4. Structure of DNA - The Watson and Crick model	05 - 06
5 RNA - Occurrence, chemical composition and components	07 - 09
6. Types of RNA	09 - 10
7. Reference	11

Molecular Biology - Nucleic acids

Nucleic acids are found in all viruses, living organisms and carry the genetic information from one generation to next generation. Generally, in eukaryotes the nucleic acids are associated with protein to form nucleoprotein and in prokaryotes the nucleic acids are not associated with protein.

Friedrich Miescher (1869) a Swiss biochemist first isolated a new class of chemicals from the pus cells, leucocytes obtained from discarded surgical bandages, which he called "nuclein". These substances later were called nucleic acid by Altmann in the year 1899 because of their acidic properties and association with nucleus.

P.A. Lavenu in the year 1920 worked out the basic chemistry of nucleic acids, discovering that there are two types of nucleic acids.

- i) Deoxyribonucleic acids (DNA)
- ii) Ribonucleic acids (RNA)

Deoxyribonucleic Acid (DNA)

- The DNA is found in all plants, animals, prokaryotes and some viruses. In the eukaryotes it is present in the nucleus, chloroplast, and in mitochondria whereas in prokaryotes, it is present in the nucleoid.
- The DNA present in the nucleus is found in the chromosomes.
- In plants, animals and some viruses the DNA is double stranded except in viruses such as bacteriophages, fd and some animal virus, parvovirus. In these viruses, the DNA is single stranded.
- In eukaryotic cells, the DNA is associated with the protein called histones to form nucleoproteins. In prokaryotes, the DNA lacks histones.

DNA as the genetic material

In 1938 Frederick Griffith, a British medical officer working on the pathogenicity of a bacterial strain Streptococcus pneumoniae (Diplococcus pneumonia) discovered the process of transformation. This strain of bacteria causes bacterial pneumonia in mammals including man. This bacterium is found in two forms as follows.

chemical Composition of DNA

DNA is a macromolecule made up of many monomeric units called nucleotides. There are four types of monomers known as deoxyribonucleotide monomers or the deoxyribotides. Each deoxyribonucleotide consists of a pentose sugar, a phosphate group and a nitrogenous base. purine bases are heterocyclic and two ringed and pyrimidine bases are one ringed bases.

component of Deoxyribonucleotide

- i) Deoxyribose: A pentose sugar consisting of four carbon atoms 1, 2, 3 and 4 which combine with one oxygen to form a ring and fifth atom forms a CH_2 group which is present outside this ring. These -OH groups are attached at position 1', 3' and 5' and the hydrogen atoms linked at carbon 1', 2', 3' and 4'.
- ii) Nitrogen bases: There are two groups of nitrogen bases, pyrimidines and purines. pyrimidine molecule is a six numbered aromatic ring that consists two nitrogen atoms at position 1 and 3. purine molecules are larger when compared to pyrimidines. The purine molecules consist of a pyramidine ring fused with an imidazole ring with nitrogen 1', 3', 7' and 9' positions.

pyrimidines consists - Thymine and Cytosine
 purines consists - adenine and guanine
 uracil is present in RNA in place of a thymine.

iii) A phosphate group: In RNA, a phosphate group (PO_4^{3-}) is attached to the 3'-carbon of deoxyribose sugar of one nucleotide and 5' carbon of the deoxyribose sugar of next nucleotide.

iv) Nucleosides: The combination of nitrogen bases and pentose sugar are called as nucleosides.

on the basis of different nitrogen bases the nucleosides of DNA are as follows.

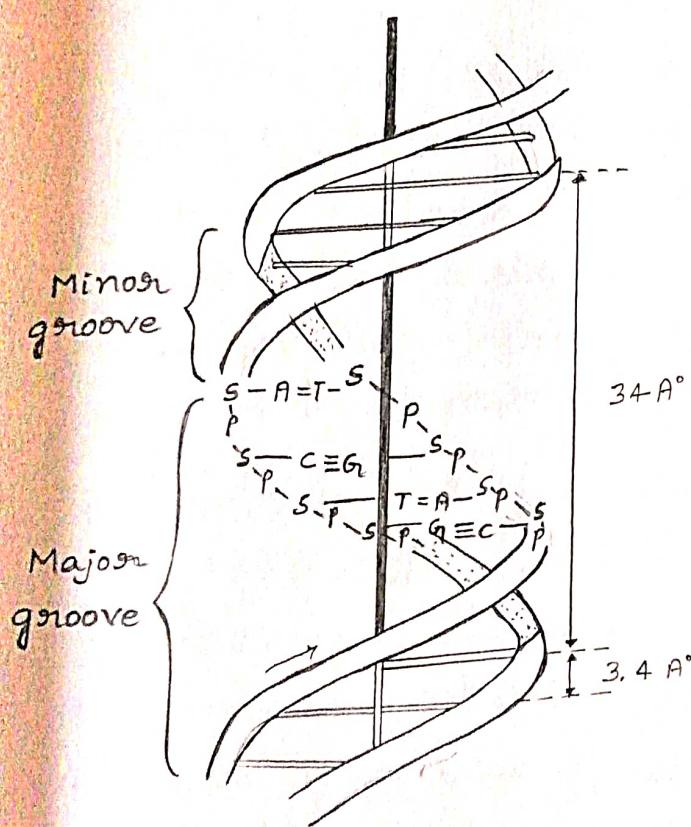

1. Deoxyribose + Adenine \rightarrow Deoxyadenosine
2. Deoxyribose + Guanine \rightarrow Deoxyguanosine
3. Deoxyribose + Cytosine \rightarrow Deoxycytidine
4. Deoxyribose + Thymine \rightarrow Deoxythymidine

v) Nucleotides: The nucleotides are monomeric units of nucleic acid. The nucleotide consists of a nucleoside linked with phosphoric acid by a phosphoester bond.

vi) Polynucleotides: The four nucleotides are present in plenty and are linked by phosphodiester bonds to form a polynucleotide chain.

STRUCTURE OF DNA (Watson - Crick model)

James D. Watson and Francis H.C. Crick in the year 1953, of Cambridge University in England, on the basis of studies of Pauling and Corey, Chargaff's analytical results and Franklin and M. H. F. Wilkins x-ray diffraction studies and crystallographic data proposed a three dimensional model to explain the structure of DNA.

The Watson - Crick model of DNA

The following are some of the characteristic features of DNA model

- DNA molecule is composed of two polynucleotide strands running anti parallel to each other

- The polynucleotide strand is made up of backbone of sugar and phosphate forming its long axis, and bases are at right angles to it.
- Each polynucleotide is made up of many nucleotides which are linked by phospho-diester bonds.
- The two polynucleotide strands of DNA molecule are coiled right handedly to form a double helix. Such a form of DNA is now called B-DNA.
- The two polynucleotide chains are held by hydrogen bonds between the purine and pyrimidine bases of opposite strands. pairing of bases is specific i.e., the adenine pairs with thymine and guanine pairs with cytosine
- The amount of purines and pyrimidines are equal ($A + G_1 = T + C$). The amount of adenine is equal to thymine and amount of cytosine is equal to amount of guanine. According to Chargaff's rule of equivalence, $A = T$ and $C = G_1$. The ratio of $\frac{A+T}{C+G}$ is always constant.
- The bases in the two polynucleotide strands are complementary to one another.

Ribonucleic acid - RNA

Occurrence

Ribonucleic acid is mainly found in the cytoplasm, little in nucleolus and in nucleoplasm associated with chromosomes. It is present in all organisms, prokaryotes and the Eukaryotes. It usually occurs as long unbranched polymeric molecule made up of single chain of polynucleotide. In certain viruses where the RNA is double stranded. It is the genetic material in some plant viruses and plays a major role in protein synthesis.

Chemical Composition

RNA molecules are synthesized all the time during the life of a cell. It takes place on one of the strands of DNA by a process called transcription.

The general structure and composition of RNA is similar to that of DNA but differs from DNA with certain features. It is a macromolecule made up of many monomeric units called nucleotides. There are four types of ribonucleotides. Each ribonucleotide consists of a pentose sugar, a phosphate group and a nitrogen base. Purine nitrogen bases are adenine and guanine, and the pyrimidine bases are cytosine and uracil.

CYANOBACTERIA

We have studied two types of Cyanobacteria.

↳ Nostoc. ↳ Spirulina.

↳ NOSTOC:— Habitat—

The genus Nostoc is a common blue green algae found in fresh water, moist soil etc. forming small light green mucilaginous balls. It is also found generally in rice fields, occasionally it may be found on most barks of trees. It secretes a large amount of mucilage which holds together hundreds of filaments. They are also distributed in tropical and sub-tropical regions of the world. Approximately more than 24 species of Nostoc are identified so far. Certain species of Nostoc are also occurred as endophytes, present with the body of other plants like thallus of Anthoceros, roots of Cycad etc.

Systematic position—

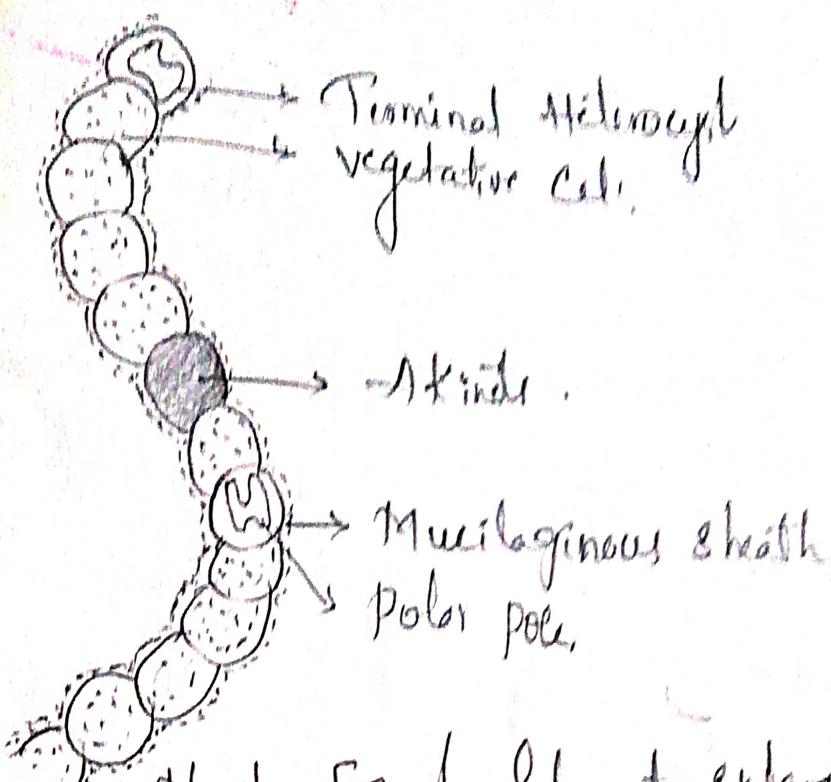

Class- Cyanophyceae

Order- Nostocales

-family - Nostocaceae

Genus - Nostoc.

Morphology:

The plant body of Nostoc is trichome. The trichome is unbranched & consists of many oval or bead like cells attached end to end. The heterocysts are thick walled and colourless cells. Depending on their position in the trichome they may be called "Intra-cellular" and terminal. Each heterocyst consists of a swelling at the poles called 'polar nodules' through which cytoplasmic connections run. Heterocysts are supposed to help in reproduction.

2. SPIRULINA:-

Systematic position:-

Class - Cyanophyceae

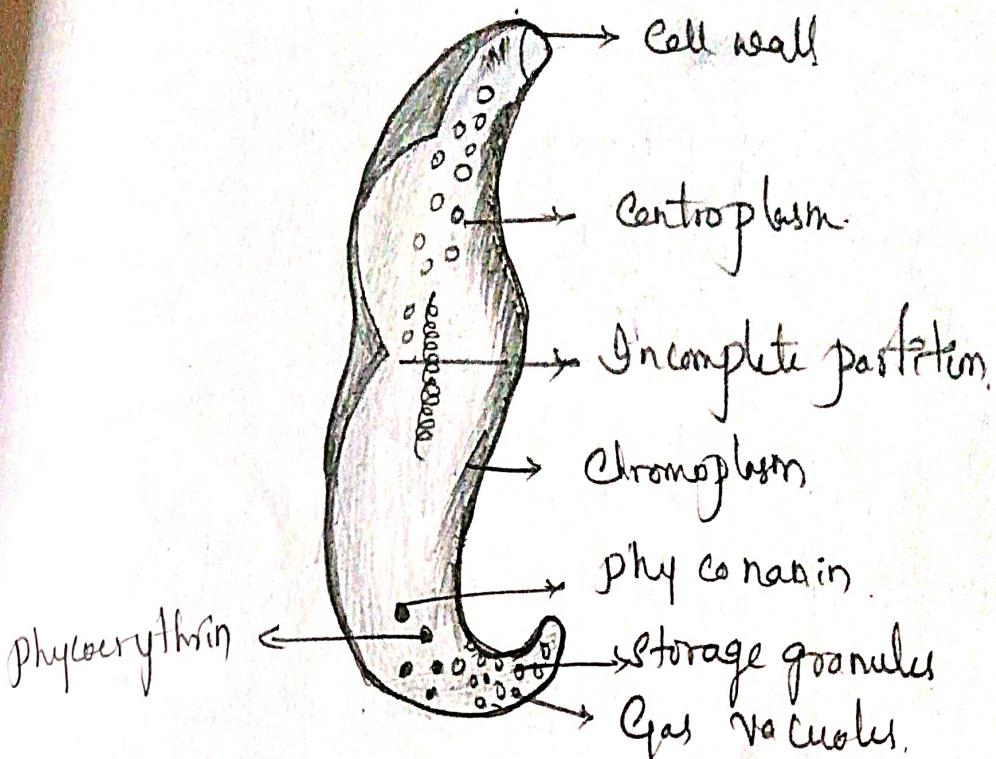

Order - Nostocales

Family - Oscillatoriaceae.

Genus - Spirulina

Habitat:- Spirulina is a free floating alga found in freshwater ponds & ditches. It is one of the common planktonic alga. The alga may also grow in brackish water containing high concentration of salts. Some of the common Indian species are *S. Subtilis*, *S. maxima*, *S. subalata*, *S. platensis* etc.

Structure of the plant body → Plant body of Spirulina is trichome & formed by a single long spirally twisted cell. Sometimes cross walls may be found making multicellular. According to some phycologists the cross walls are incomplete. The spiral cells twisting of the trichome may be loose or close and the cells are cylindrical in shape and are without sheath. The terminal cell is rounded and is without calyptra.

Spirulina (enlarged filament)

The cells exhibit active rotational movement.

Reproduction: → No sexual reproduction. Asexual reproduction is by fragmentation.

Economic Importance

- 1) Spirulina is a N_2 fixing blue green algae.
- 2) Spirulina causes water blooms.
- 3) Some of the current researches indicate that Spirulina holds a great promise as a source of single cell protein. Even though much research work has been conducted the single cell algae Chlorella as a source of food research on Spirulina is still in its infancy. Biotechnology section of CFTRI has done a great deal.

2018 - 2019

PALYNOL OGY

Introduction:

Palynology is the science that studies pollen.

Palynology is a relatively recent science and there are many opportunities for its practical application. The study of the symmetry, polarity, shape, size, structure, sculpture and of the aperture of the spores can be very useful to many other sciences. Pollen is an indicator which enables researchers to study the phytogeography of the past plant evolution, climates, rock and soil characteristics, air pollution levels, plant-insect relationships and the botanical and geographical origin of bee products etc..

To understand pollen polarity it is necessary to study the situation inside the teeth of the anthers; at first the pollen grains resulting from the meiotic division of mother cells are gathered into groups and they can remain like this forming trilets, tetrads or polyads. The tetrads can be tetragonal, tetrahedral or rhomboidal the polyads can be formed by a larger number of

granules. Observing the position that the pollen grain first has in the tetrahedral agglomerate 2 poles are noted: the proximal and the distal. If the poles are equal, the pollen is defined as isopolar and if they are unequal as anisopolar. Spherical pollens have no polarity.

The description of a pollen is based on particular ratios and measures that best characterize that particular pollen. The morphology of a pollen grain is measured by the ratio of the length of the polar axis to the equatorial diameter; the correlation between Sporoderm thickness and pollen size is measured by the ratio between Sporoderm thickness and the equatorial axis; in reality the indicator of the polar area is the ratio of this area to the equatorial diameter but in practice only the distance between colpi extremitie near the poles is measured.

Different types of pollen symmetry exist; there are isopolar granules in radial symmetry; i.e. granules with a horizontal symmetric plane and two or three vertical symmetric planes; then there are anisopolar granules in radial symmetry.

Shape :-

The ratio between the polar axis and the equatorial diameter of a pollen gives us the shape of the pollen. Pollen shapes have been classified as follows.

a) Perporolate.

b) Porolate

c) Subporolate.

When observed in polar view, a pollen grain will have one of the following shapes: circular, semi-angular, interhexagonal, angular, interangular, semilobate, intersemilobate, lobate, interlobate, exagonal, interexagonal, subangular and intersubangular.

For the fewer compounds a more restricted and synthetic terminology is used: circular, subcircular, subtriangular, quadrangular, pentagonal etc. While in equatorial view the most typical shapes are circular, rhomboidal, apiculate, rectangular and oval. In asymmetrical pollen the pollen can be either biconvex or concave-convex (mauvezo and Louveaux).

Sizes:-

These vary greatly, but are generally divided into six categories, although this number could be increased.

Very small pollen (*Mycelotis*).

Small pollen (*Salix*).

Medium pollen (*Quercus*).

Large pollen (*Zea*).

Very large pollen (*Cucurbita*).

Giant pollen (*Mirabilis*).

Aperitures:-

In some cases pollen do not have apertures but more frequently they do. Traditional Palynology usually characterizes apertures by their number (number), position (position) and shape (character). The N.P.C parameter is fundamental in pollen description. The number can vary from 1/1 to N/4: N1 is attributed to pollen with one aperture; N4 is for pollen with several apertures. Inaperturate pollen are-

marked with No. The position parameter in
pollens has 4 variables - P0 to P6 in P0 the location
of the apertures is unknown; if the apertures
is in a pole it is defined as proximal or distal.
P2 designates a pollen with two apertures both at
the pollen poles. If the apertures are set in the
equatorial zone then this is a zonal position
pollens with apertures distributed over the whole
grain surface are identified as P6. Apertures are
also characterized by their shape. In C0 the open-
ture is indistinct while in C1 it is represented
by a more or less regular area. In C2 the
aperture is indistinct while in C1 it is repre-
sented by a less regular area. In C2 the
aperture is divided into three anastomosed arms
(trichotomocolpal pollen) [Some Palmae, many Spores].
C3 is the term used for scutus-shaped apertures
and C4 for pore-shaped ones; we can refer
to these as colpal pollen and poral pollen. C5 is
used for colporal pollen, i.e. pollens whose open-
tures have both a pore and a colpus. Lastly
there are the CG poroporal pollens which have

both a pore and a colpus. Lastly there are the GG poroporate pollens which have either a colpus or a pore externally and a circular oval part set in their centre.

The following are some easily remembered examples; monocolpate, with one colpus (*Allium*); monoporate, with one pore; dicolpate, with two colpi; porcate, with two pores, (*Colchicum*); dicorporate, with two colpi and two pores; diporate with three colpi; Stéphanocolpate, with more than three colpi in equatorial position (*Thymus*); Stéphanoporate (*Campanula*); Stéphano colporate pericolpate; periporate (*Chenopodium*); polyvagale with very short colpi; synapcolpate, where the extemities. colpi alternate with pseudocolpi heteroporate.

The apertures can be elongated along the meridian axis (elongate) or long the equatorial axis; the colpi can be short or very short; the colpi are sometimes surrounded by an ectexine frame; the pores are sometimes surrounded by a circular ring. Near the frame.

Assignment - 5

Sexual Reproduction in albugo

- * Sexual reproduction is Oogamous type.
- * It takes place by Gametangial contact.
- * The male sex organ is called as Antheridium.
- * The female sex organ is called as Oogonium.

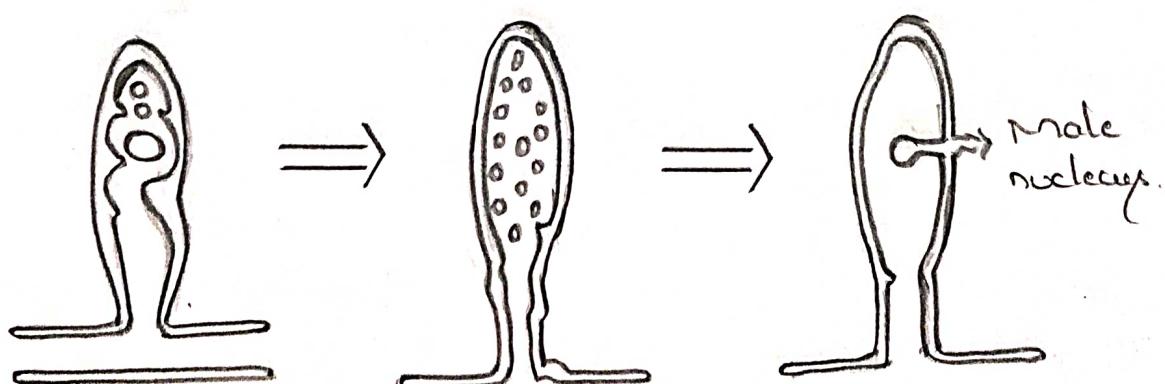

Antheridium

Oogonium.

Antheridium

- * It is developed from a branch of hyphae known as Antheridial Primordia.
- * The Antheridial branch swells to form a multinucleate club shaped structure called Antheridium.

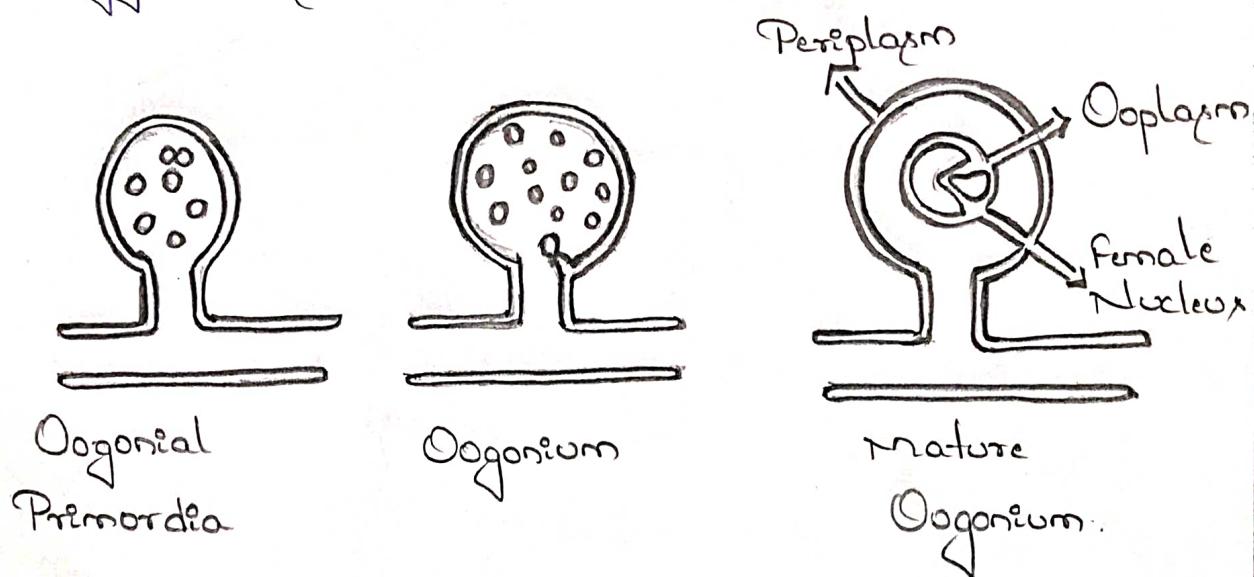

Antheridial
Primordia

Antheridium

Mature
Antheridium

Oogonium

- * It is developed from a branch of the hyphae known as Oogonial primordia.
- * The Oogonial branch bulges to form multinucleate spherical structure called Oogonium.
- * The protoplast of the Oogonium gets differentiated into Outer periplasm.
- * All the nuclei of the Ooplasm except one degenerate.
- * At the time of fertilization only one functional nucleus is present in the Ooplasm, which is called as egg nucleus.

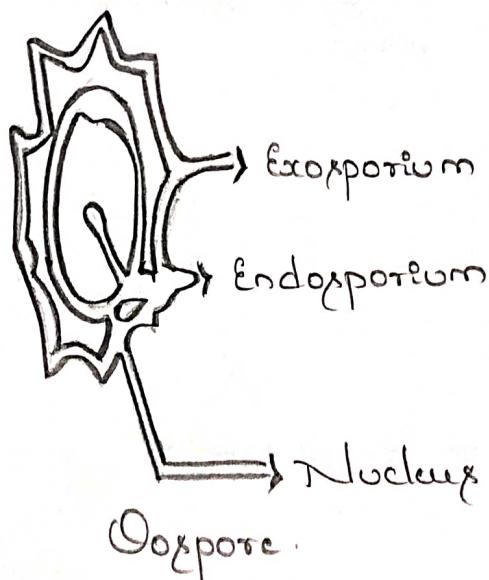

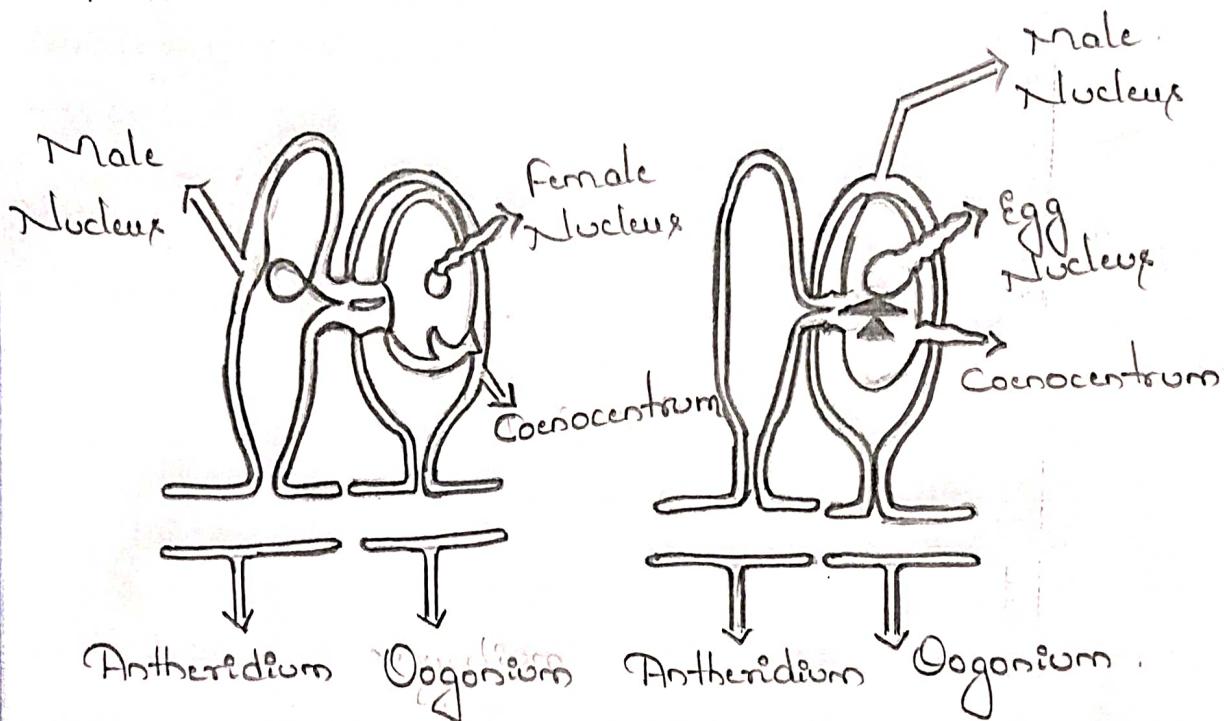

Fertilization

- * At the time of fertilization all the nuclei except one of the antheridium disintegrate.
- * The only nucleus which acts as the functional male nucleus.
- * The antheridium at the region of receptive spot produces a tubular structure called fertilization tube.
- * which carries the male nucleus.
- * The fertilization tube after in the Ooplasm opens to release the male nucleus.

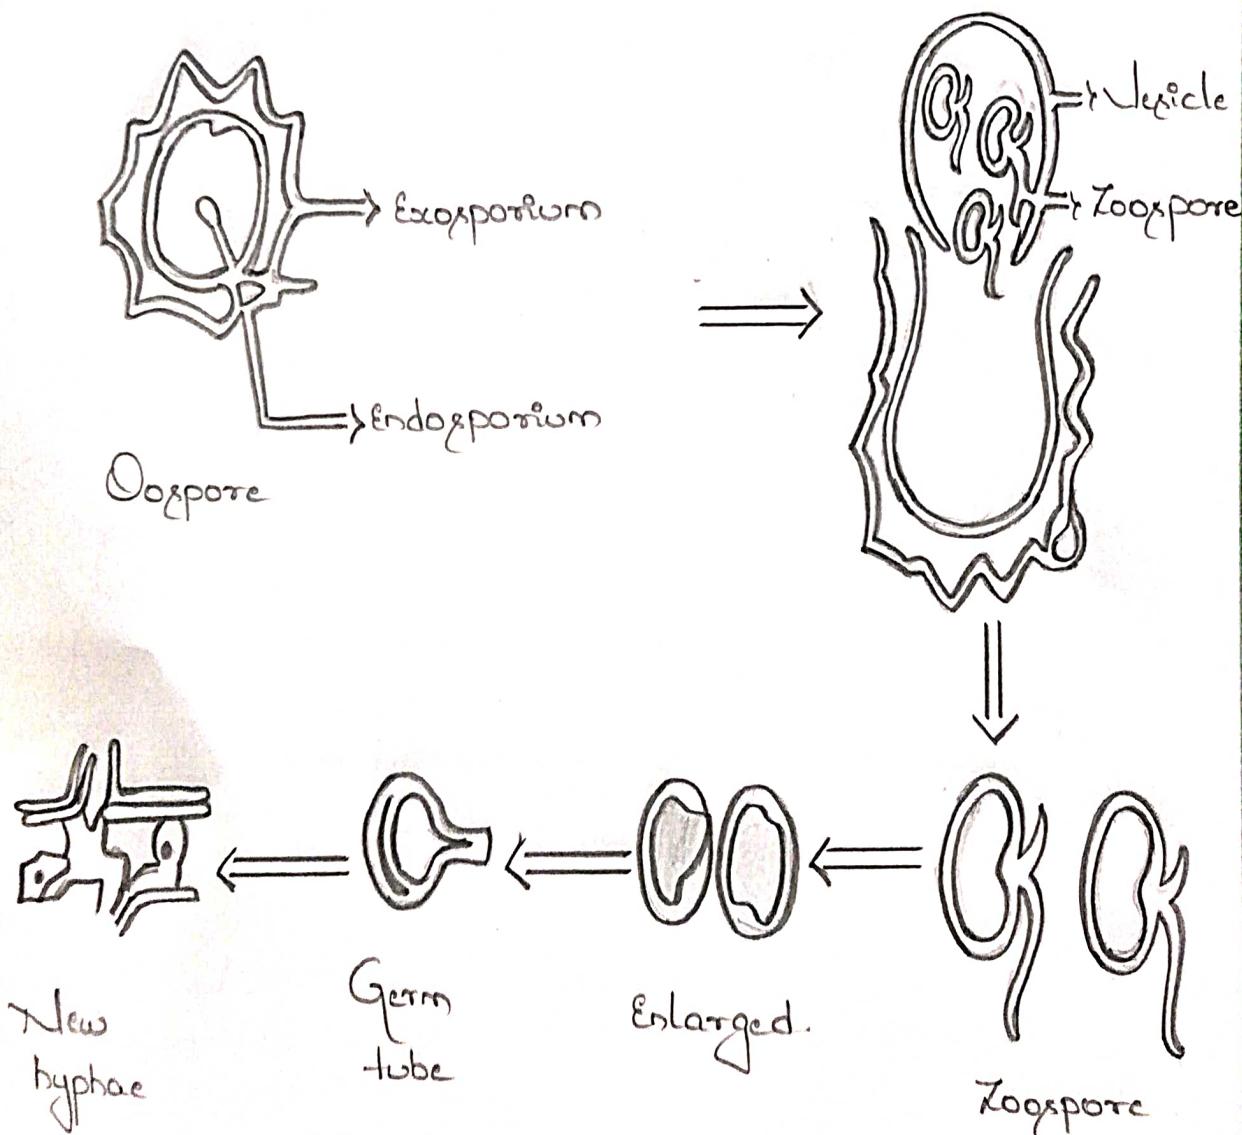

* Prior to syngamy a cytoplasmic body appears in the ooplasm which is known as Coenocentrum.

* There will be union between male nucleus and egg nucleus, which results in a diploid structure called Oospore.

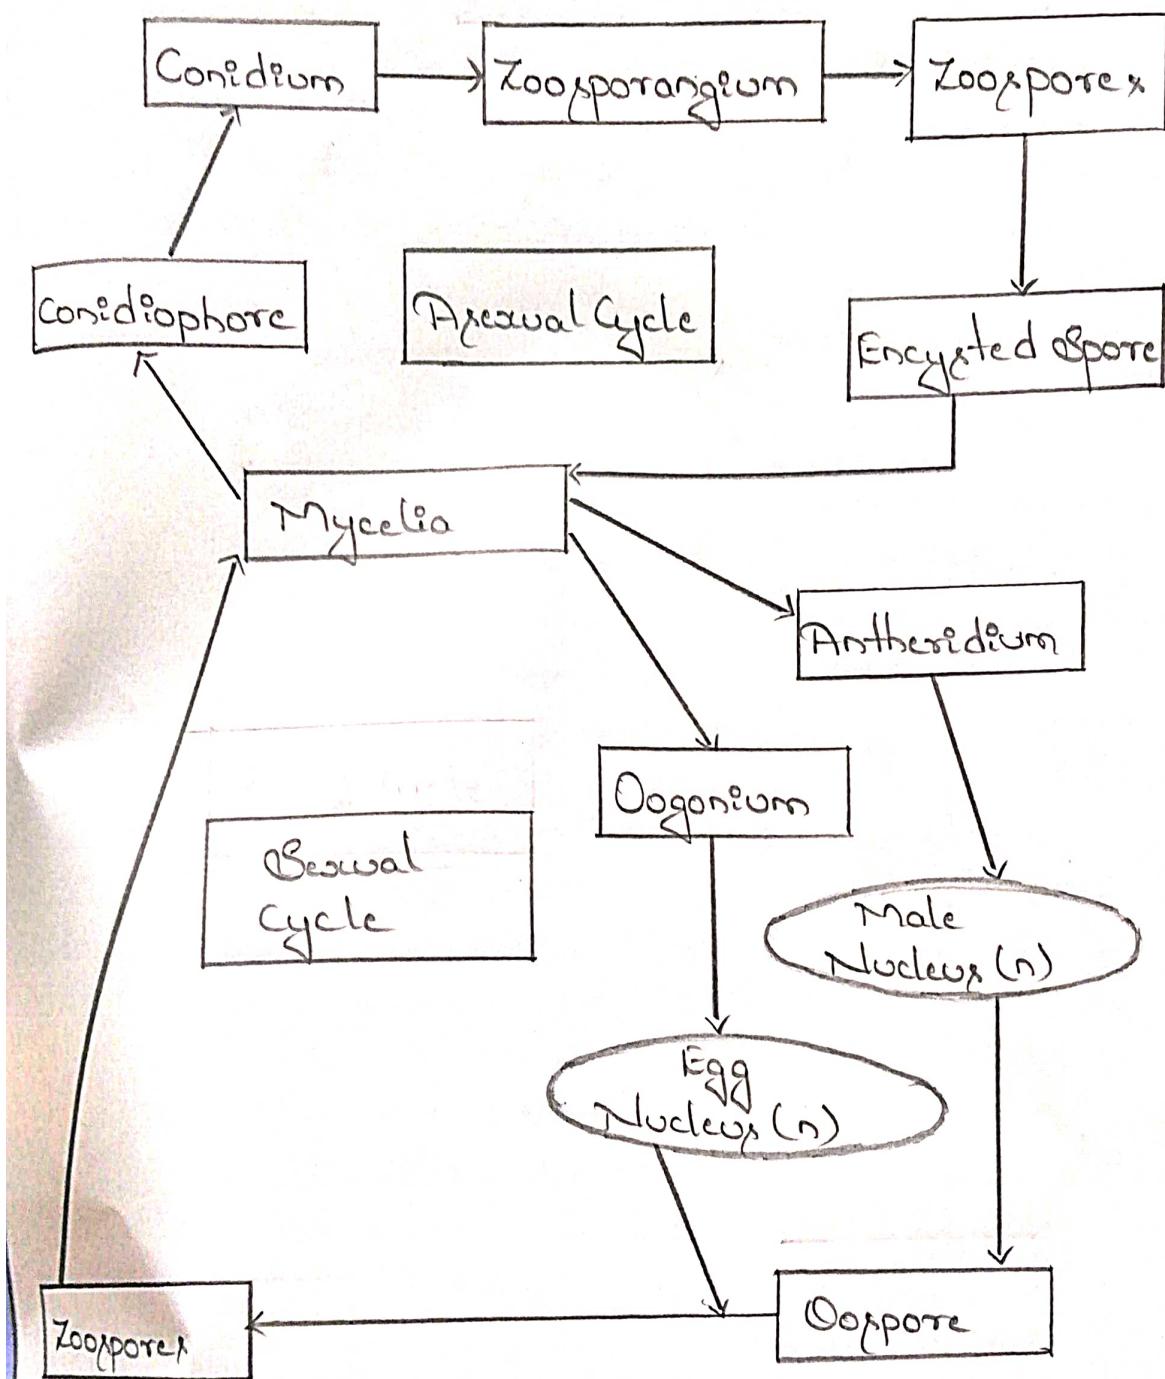

Oospore

- * Oospore is a diploid, spherical, thick wall structure.
- * The wall of the Oospore consists of outer exosporeum and inner endosporeum.
- * During germination - the diploid nucleus undergoes meiosis resulting a number of haploid zoospore which are released into vegetile.
- * When the vegetile digests zoospore becomes free which loose their flagella and undergo Encysted condition.
- * Each encysted zoospore germinates into a new hyphae.

Reproduction in Phytophthora :-

Phytophthora reproduces by three methods,

- ① Vegetative reproduction
- ② Asexual reproduction
- ③ Sexual reproduction

Vegetative Reproduction:-

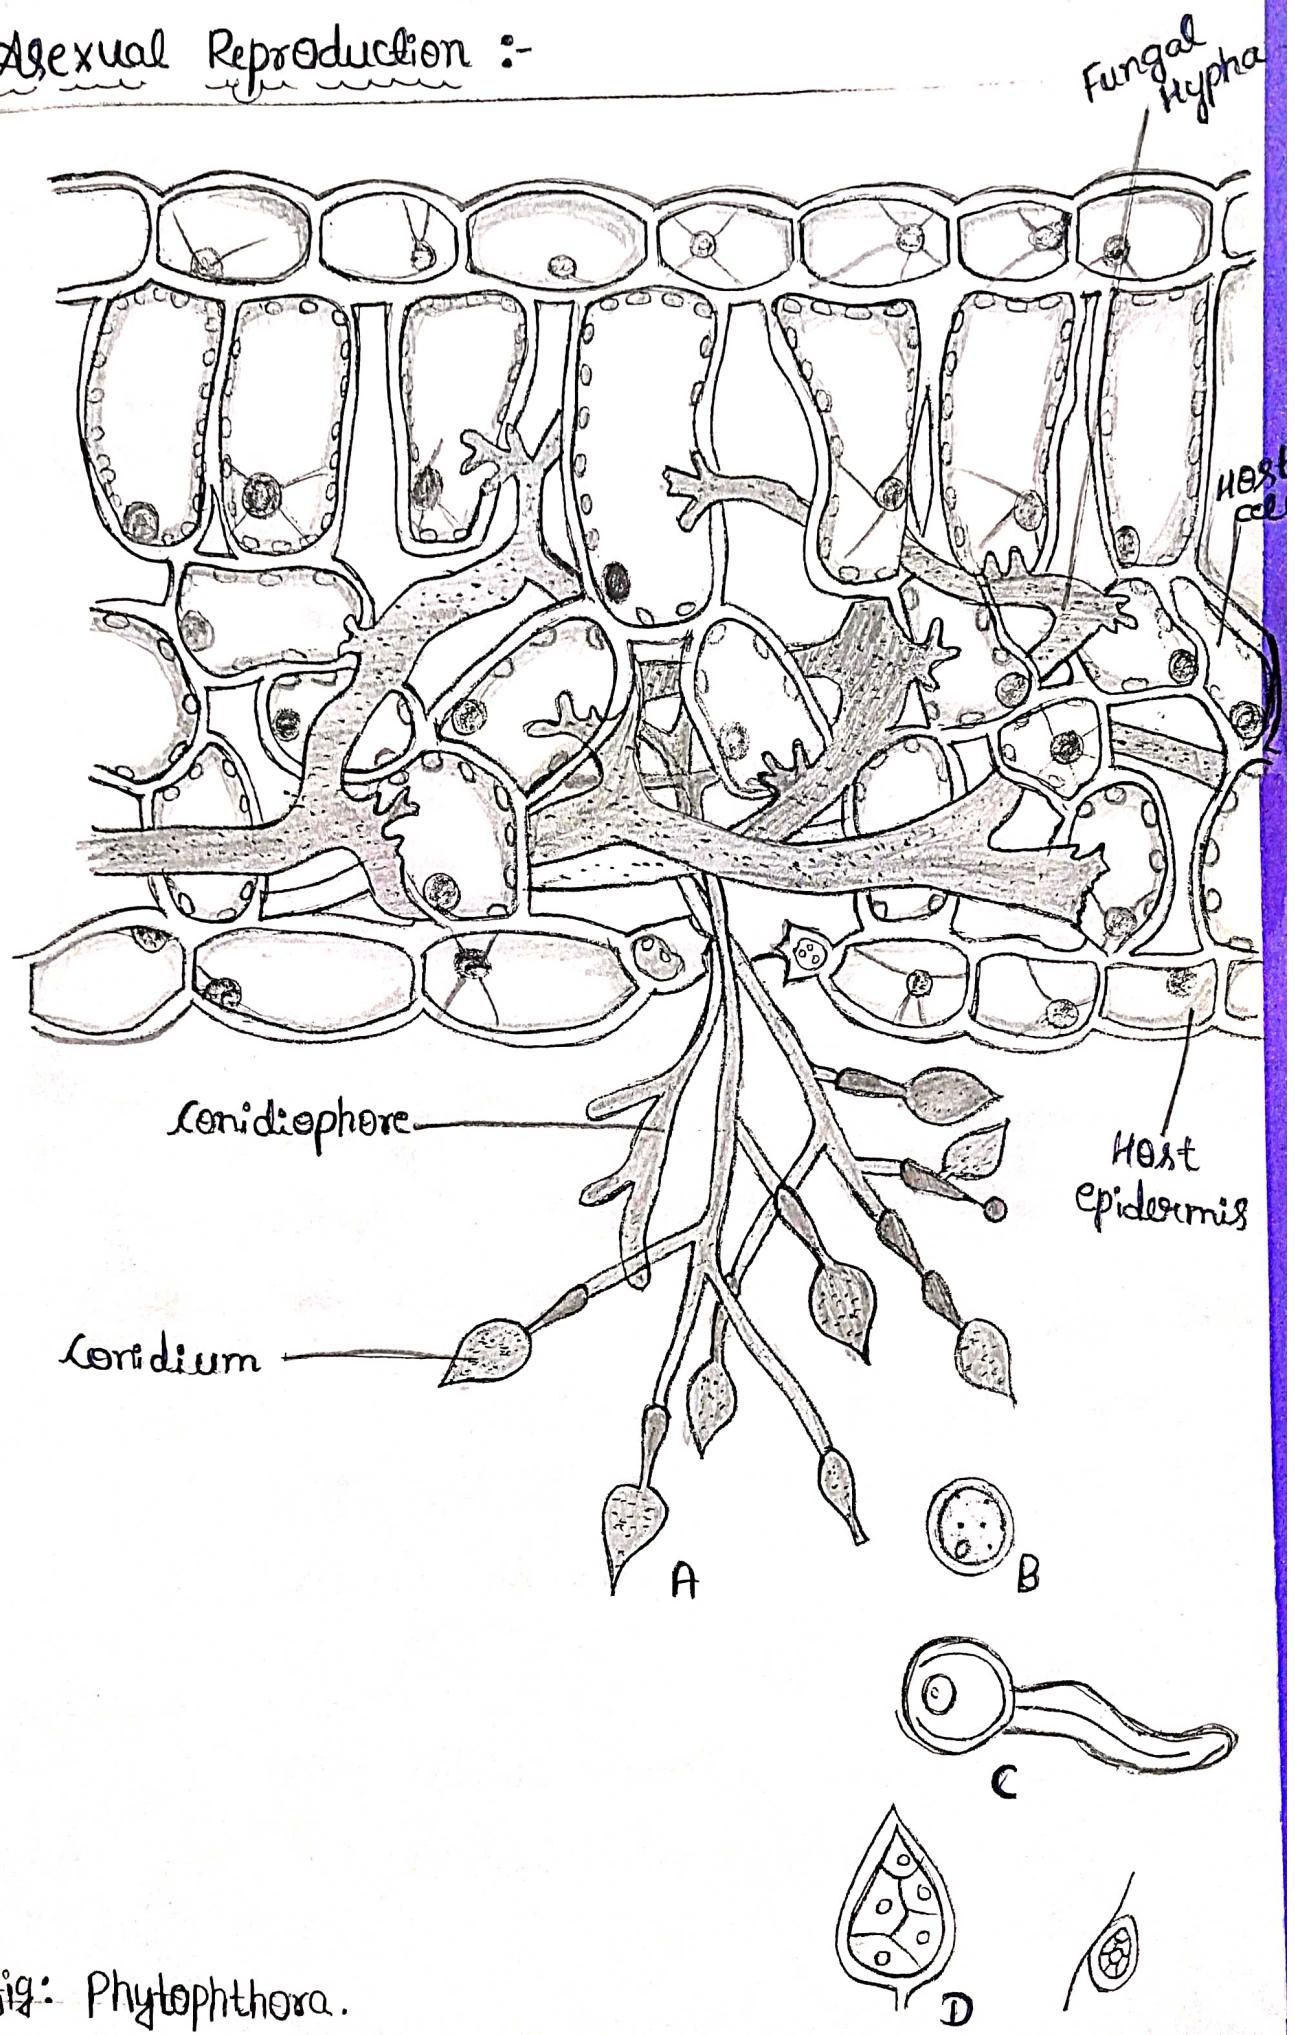

Vegetative reproduction occurs through chlamydospore formation.

The structures are formed by sum of the segments of the hyphae which become spherical and develop thick wall around it.

During favorable condition each spore develops into new plant body.

Asexual Reproduction :-

Phytophthora

- A) Fungal hyphae showing conidiophore bearing conidia.
- B) Germination of Conidium.
- (C, D, E) Production of zoospore

Phytophthora reproduces asexually by the formation of sporangia

Sporangia produce on special aerial hyphae called conidiophore or sporangiophores.

During asexual reproduction the intercellular mycelium produces sporangiophores.

Each sporangiophore at its apex produces a sporangium.

Though sporangium formation is terminal. It shifted to lateral side due to the continuous growth of the sporangiophore.

Asexual Reproduction is occur by 2 ways:

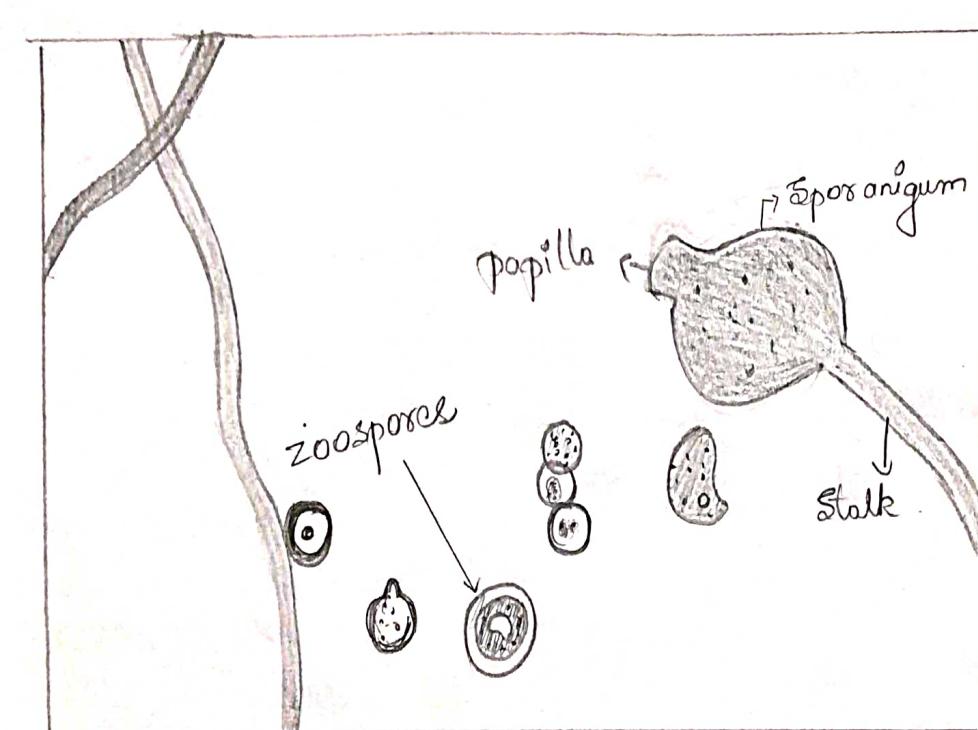

1. Direct method
2. Indirect method

Indirect method:

- * It takes place during moist weather and low temperature conditions.
- * During indirect germination the protoplast of sporangium undergoes cleavage, resulting a number of unnuclated bit.

Each uninucleated cell metamorphosis into a
zoo spores.

The sporangium is a oval or lemon shaped structure. It has a short stalk at the base, at the apex a beak like projection is seen known as papilla.

After the formation of the zoospore.

- * The sporangium opens to release the zoospore
- * Each zoospores are biflagellate structure.
- * One flagella is short known as thiel type and the other long known as whiplash type.
- * The liberated zoospores swim for a while withdraw their flagella and come to rest.
- * Resting zoospores is known as Encysted spores
- * Each resting zoospores germinates by a germ

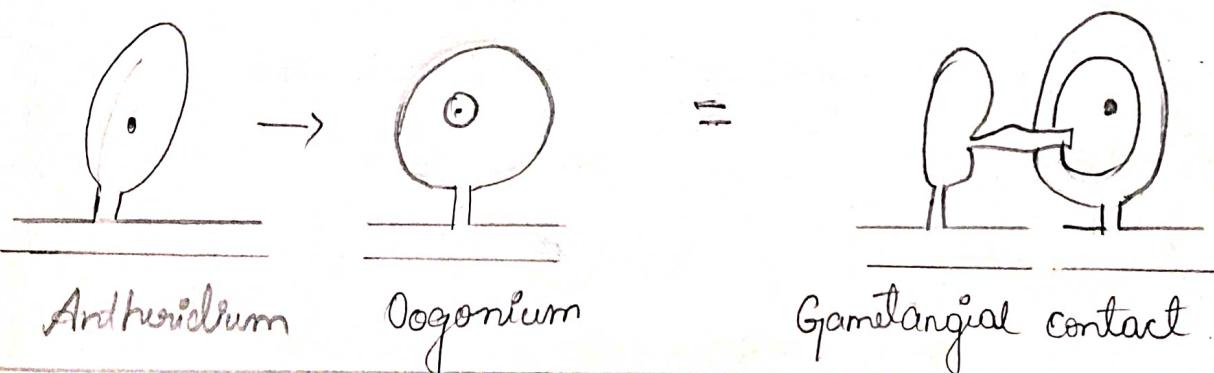

tube which forms a new hypha.

Direct method :

- * It takes place during dry weather and high temperature condition.
- * This method is similar to Indirect method.
- * But in this method zoospores not attaining resulting stage.
- * It direct develops into New hyphae.

Sexual reproduction :

- * Phytophthora reproduce sexually by the formation of Sex Organ the male Sex Organ is Antheridium and the female Sex Organ is Oogonium.
- * The Sexual reproduction is Oogamous type. takes place by Gametangial contact.

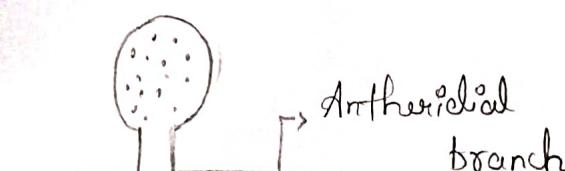

Antheridium :

- * During the formation of antheridium. The hyphae produces a special branch known as Antheridium branch.

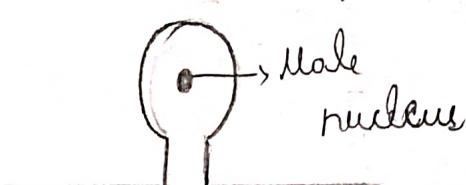

The Antheridium branch enlarges to form a club shape structure.

* It is multinuclei in the beginning later all the nuclei except one degenerate.

* The nucleus present is called as functional male nucleus.

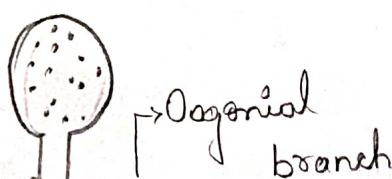

Antheridium

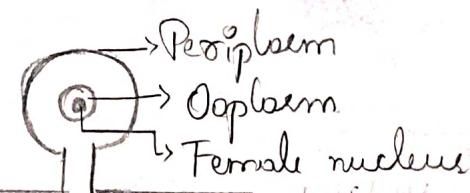

Antheridium

- Oogonium:

Oogonium

Oogonium

* It is produced by the female branch known as Oogonial branch.

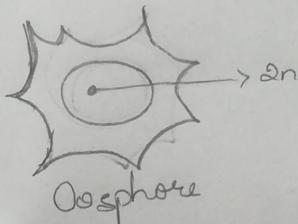

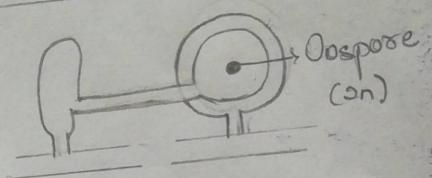

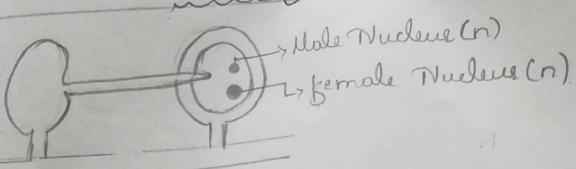

The Oogonial branch enlarges to form a spherical structure known as Oogonium.

Oogonium is multinucleate. The protoplast of the Oogonium gets differentiated into periplasm and Ooplasm.

All the nuclei except one migrate to the periplasm and three nuclei later disappear.

- * The nucleus which is present in the Oosphere is the functional Egg nucleus.

Fertilization

- * Prior to fertilization the antheridium produces a short tubular structure known as fertilization tube - which carries the male nucleus.
- * The fertilization tube enters the female nucleus where tip of fertilization tube opens and releases male nucleas.
- * The two nuclei male and female nuclei fuses to form diploid structure called Oospore or zygote. Through the process called Syngamy
- * The Oospore enlarges having thick wall around it. Differentiated into Exine and Intine

Assignment : Electroplating - 2016 - 17

Submitted To : Sahana Taj Maam
[Department of Chemistry].

What is Electroplating? Explain with Diagram.

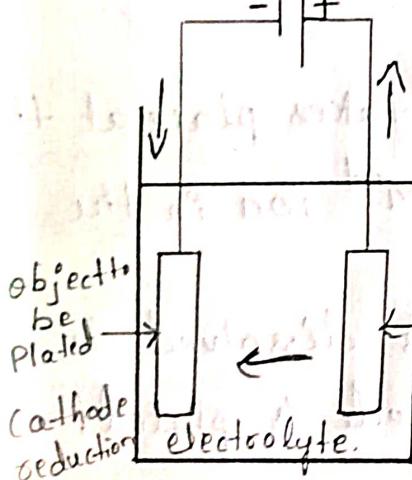

Electroplating is defined as - "The process of deposition of coating metal on the base metal by passing direct current through an electrolytic solution containing the soluble salt of the coating metal".

Ex:- Nickel plating, Gold plating.

Electroplating is one specific type of electrolysis.

Electrolysis is the process in which a direct electric current is passed through an electrolytic cell, chemical reaction takes place at the contacts between the circuit & solution.

power supply

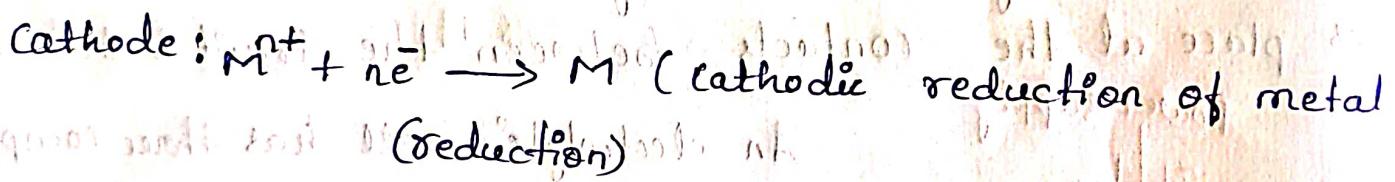

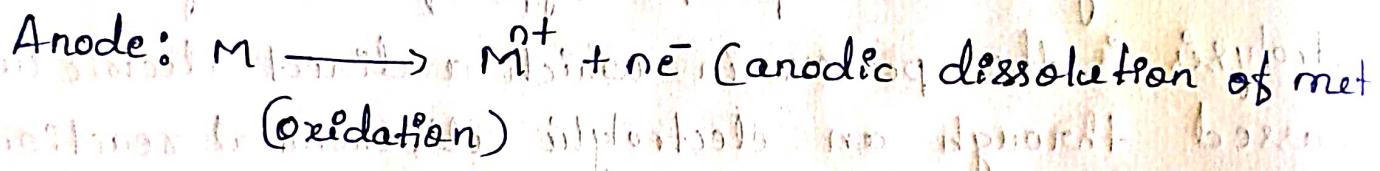

An electrolytic cell has three component parts:

- 1] Electrolyte: cell filled with a suitable salt solution of the metal being deposited.
- 2] Anode: A pure metal rod or plate.
- 3] Cathode: It is the object being plated.

A solution of the desired metal which is to be coated (electrolyte) is taken in the beaker. Two electrodes connecting with the battery are immersed in it. One electrode is the article to be coated which is connected to negative terminal of battery (cathode).

The other electrode is the (anode) pure metal whose coating is to be applied, which is connected to positive terminal of battery. The whole set up is known as electrolytic bath.

Upon electrolysis the anode metal dissolves as M^{n+} the metal ions migrate to the cathode and get deposited there. Thus a thin coating of metal is produced on the article made as cathode.

In ideal situation, both the process takes place at same rate and the concentration of M^{n+} ion in the solution remains a constant.

i.e. the rate at which the anode is dissolved is equal to the rate at which the cathode is plated.

What is the main principle of electroplating?

Electroplating is the surface treatment and finishing of metals or non-metals. An electrochemical reaction is used to form a metallic coating from an aqueous solution or a molten salt. Specifications such as deposition of pure metal or alloy coatings of any composition are met by selecting materials based on deposition rate, deposition efficiency and throwing power.

Explain the steps involved in Electroplating?

Ex:- Gold Electroplating: Gold plating is an easy technique, but before beginning the process the surface of the metal to be must be clean.

Surface preparation includes the use of solvents, abrasive materials, alkaline cleaners, acid etching or combination can be used.

Following cell is used for Gold plating:

Anode :- Gold - also, Castenbergs steel & nichrome

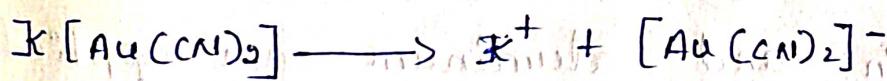

Cathode :- article.

Electrolyte :- $\text{K}[\text{Au}(\text{CN})_2] + \text{Na}_3\text{PO}_4$ (buffer)

Current density : $1.5 \times 10^2 \text{ amp/cm}^2$

Temperature : $60-80^\circ\text{C}$

The direct reduction from the complex is generally considered as the most likely mechanism for the deposition from cyanide complexes. i.e.

In the presence of various addition agents & by using acute current density & temperature the colour & shade of deposit alter.

4) What are the factors influencing electroplating?

- Factors influencing the nature of good deposit are:
1. Metal ion concentration
 2. pH of the bath
 3. Temperature
 4. Current density.

5) Explain the purpose of Electroplating.

There are so many fields in which the process of electroplating is used:

Appearance:- One the important purpose of electroplating that, it enhances appearance of the objects i.e. to increase the commercial and decorative value of base metals. Electroplating gives smooth and attractive finish to the crude metal objects.

Ex:- i] chromium plating on automobiles and kitchen appliances which gives them an up market appeal.

Protection:- Protect the metal from environmental and atmospheric conditions such as, corrosion.

Ex:- To obtain an improved wear resistance and to impart hardness is required.

Iron is likely to get eroded easily, in order to protect it from rusting, Coatings of metal such as magnesium, Zinc and aluminum are applied

What are the factors influencing electroplating?

1. Factors influencing the nature of good deposit are:
2. Metal-ion concentration
3. pH of the bath
4. Temperature
5. Current-density.

Explain the purpose of Electroplating.

There are so many fields in which the process of electroplating is used:

Appearance:- One the important purpose of electroplating that, it enhances appearance of the objects i.e.- to increase the commercial and decorative value of base metals. Electroplating gives smooth and attractive finish to the crude metal objects.

Ex:- i] Chromium plating on automobiles and kitchen appliances which gives them an up market appeal.

Protection:- Protect the metal from environmental and atmospheric conditions such as corrosion.

Ex:- To obtain an improved wear resistance and to impart hardness is required.

Iron is likely to get corroded easily, in order to protect it from rusting, coatings of metal such as magnesium, Zinc and aluminum are applied.

Special Surface Properties: In incorporating some special surface properties.

Ex:- The machinery parts requiring corrosion resistance under working conditions are plated to avoid wear and also to improve engine performance.

Engineering or mechanical properties:

In providing mechanical properties to the metal requiring corrosion combustion resistance under working conditions.

Ex:- Internal combustion engines used in Aeroplanes.

It serves in providing many mechanical properties to the metals which it lacks such as magnetic properties, resistance, light absorption etc.

Make a list of articles in day to day life, where this technique is used.

- In Artificial Jewelleries.

CHEMISTRY ASSIGNMENT

**TOPIC : ISOMERISM IN COORDINATION
COMPOUNDS**

By :

SHREEKRISHNA PAI
III B.Sc, 'B' SECTION
S1703820.

ISOMERISM IN CO-ORDINATION COMPOUNDS

Isomerism :

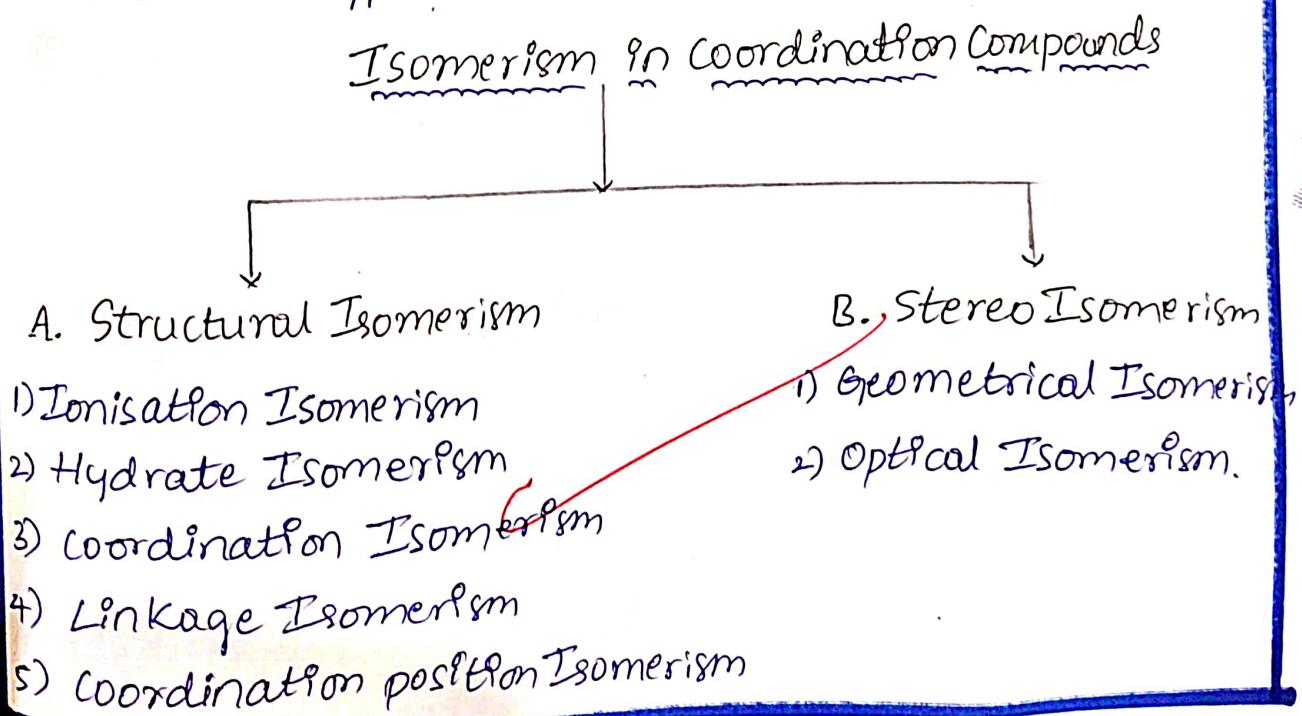

The compounds having same molecular formula but different structures and hence different physical & chemical properties are called 'Isomers'. The phenomenon of the existence of such compounds is known as 'Isomerism'.

Co-ordination compounds gives rise to a wide variety of Isomers due to the different types of linkages and different arrangements of the constituent atoms.

There are mainly two types :

- i) Structural Isomerism.
- ii) Stereo Isomerism.

These two types are further divided into several types.

A. Structural Isomerism :

i). Ionisation Isomerism :

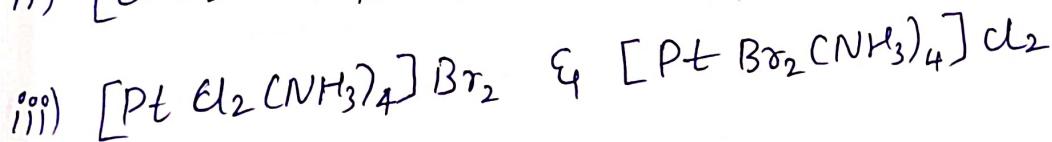

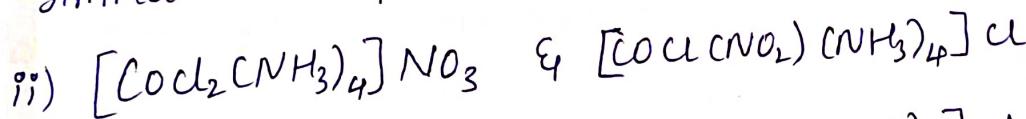

Ionisation Isomerism arises as a result of the exchange of Pon inside & outside the coordination sphere.

Example : There are two distinct compounds of the formula $\text{Co}(\text{NH}_3)_5\text{Br}\text{SO}_4$. one of them is red-violet and gives precipitate with BaCl_2 , indicating that Sulphate Pon outside the coordinate sphere.

The second one is red and doesn't give precipitate with BaCl_2 , but gives precipitate with AgBr , which indicate that, now bromide is outside the coordination sphere.

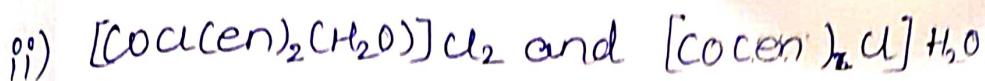

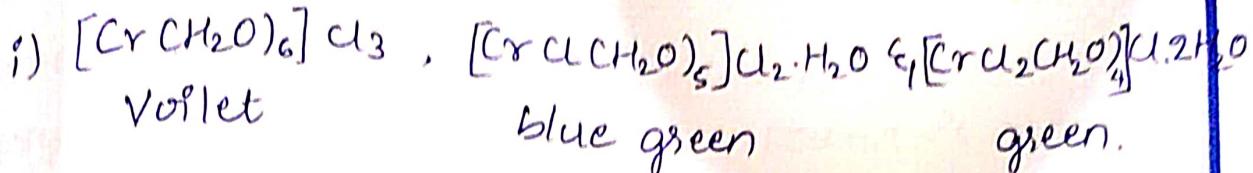

Similar examples :

ii) Hydrate Isomerism : or Solvate Isomerism
Coordination compounds having same molecular formula but differing in the number of water molecules acting as ligands are called hydrate or solvate Isomers. This phenomena is called 'Solvate or hydrate Isomerism'.

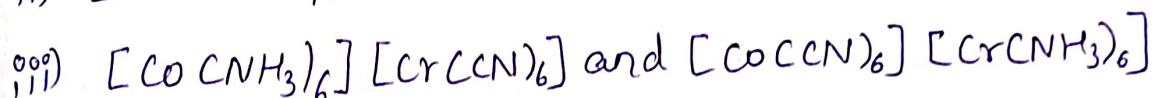

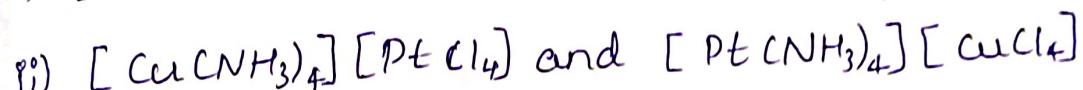

example for hydrate or solvate Isomerism:

3. Coordination Isomerism :

Coordination Isomerism arises as a result of exchange of ligands between the complex cation & complex anion.

example:

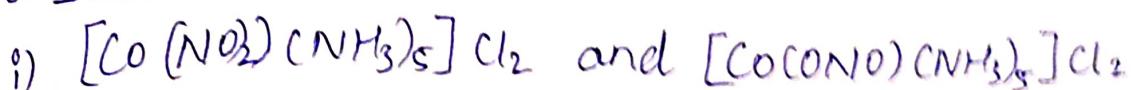

4. Linkage Isomerism :

Coordination compounds having same molecular formula but differing in the mode of attachment of a monodentate ligand to the central metal atom / ion are called 'Linkage Isomers' and this phenomena is called 'Linkage Isomerism'.

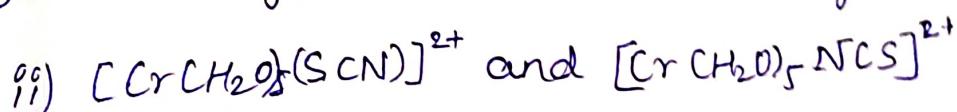

In some ligands, there are two atoms which donate their lone pairs. For example, InNO_3^- ion, The nitrogen atom as well as oxygen atom can donate lone pair.

This gives to Isomerism. If nitrogen donate its lone pair, particular compound is formed. If oxygen does so, a different compound is obtained.

example:

Other ligands which gives rise to linkage isomerism are $\text{CN}(\text{cyano})$ & $\text{NCC}(\text{Isocyano})$ & $\text{SCN}(\text{thiocyanato})$ & $\text{NCS}(\text{Isothiocyanato})$

B. Stereo Isomerism

There are two types in stereo isomerism.

- 1). Geometrical Isomerism
- 2) Optical Isomerism.

1). Geometrical Isomerism :

Geometrical isomerism arises in heteroleptic complex due to different possible arrangement of ligands around the central metal atom / ion.

The ligands occupies positions either adjacent to one another or opposite to one another. They are referred as 'cis' & 'trans' respectively.

If the like groups are adjacent to each other then Pt is a 'cis' isomer.

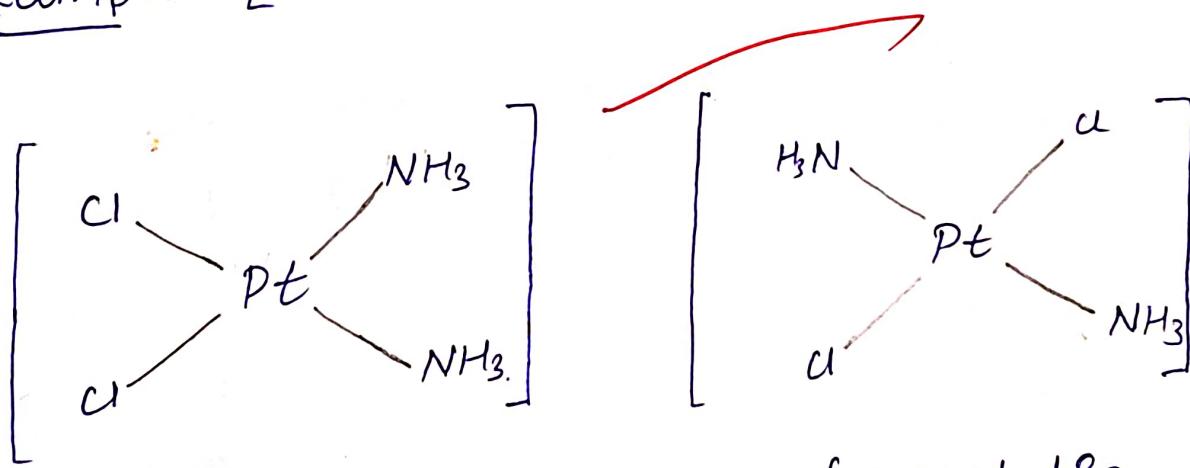

If the like groups are opposite to each other then Pt is a 'trans' isomer.

'Geometrical Isomerism in complexes of coordination number - 4.'

Cis-trans Isomerism is not possible in tetrahedral complexes because all four ligands are adjacent to each other. However, cis-trans isomerism very common amongst 'square planar' complexes.

a). complexes of type Ma_2b_2 :

example : $[PtCl_2(NH_3)_2]$

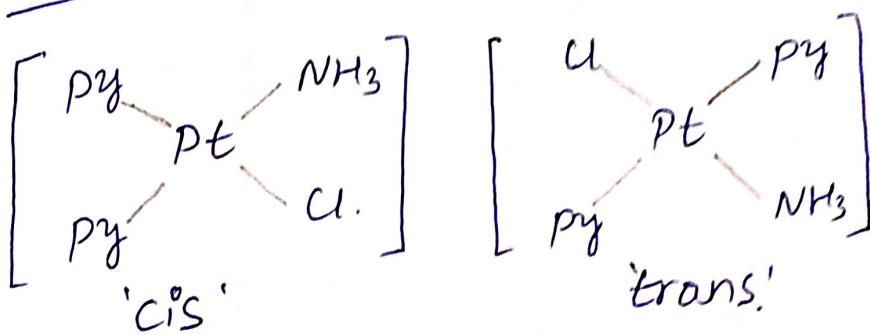

cisplatin

transplatin.

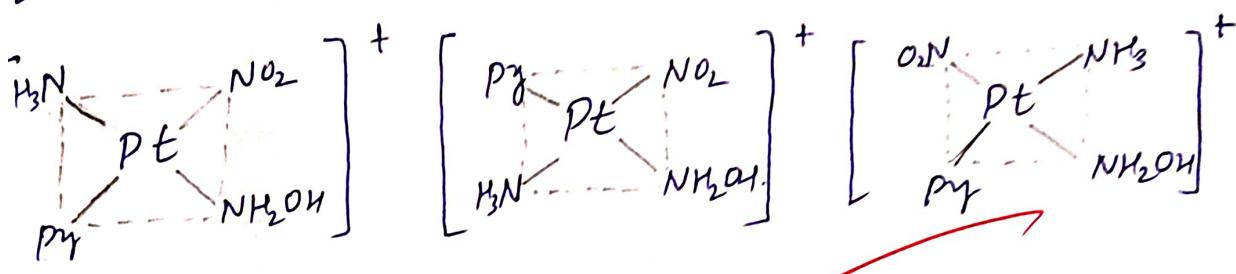

c. complex of the type $M_a b c$:

Example: $[Pt(\text{py})_2\text{NH}_3\text{Cl}]$

d. complex of the type $M_a b c d$:

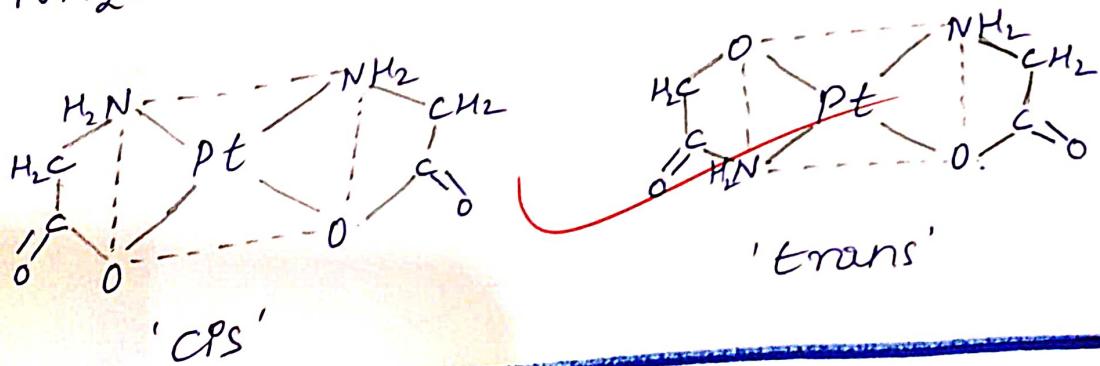

Example: $[Pt(\text{CNO})_2(\text{C}_5\text{H}_5\text{N})(\text{NH}_3)(\text{NH}_2\text{OH})]^+$

d. Geometrical isomerism cannot occur in complexes of type $M_a a_4$, $M_a b_3$ or $M_a b_3$, because all possible spatial arrangements for any of these complexes are equivalent.

e. The square planar complex containing unsymmetrical bidentate ligand $[\text{M}(\text{ab})_2]$ also show geometrical isomerism.

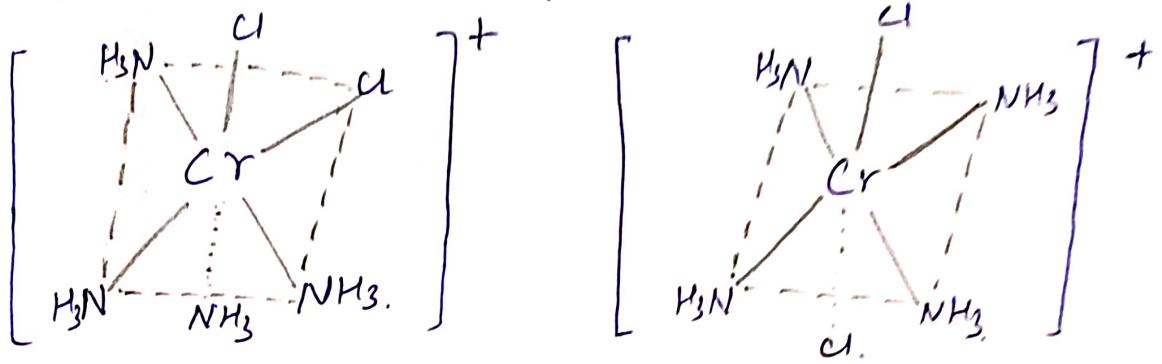

Example: $[\text{Pt}(\text{gly})_2]$ where gly stands for $\text{NH}_2\text{CH}_2\text{COO}^-$ exists in cis & trans form.

Geometrical Isomerism in complexes of coordination number 6.

The complexes having coordination number 6 adopt 'Octahedral Geometry'. They are also exhibit geometrical Isomerism.

a. complexes of the type Ma_4b_2 or Ma_2b_4 or Ma_4b_3 :

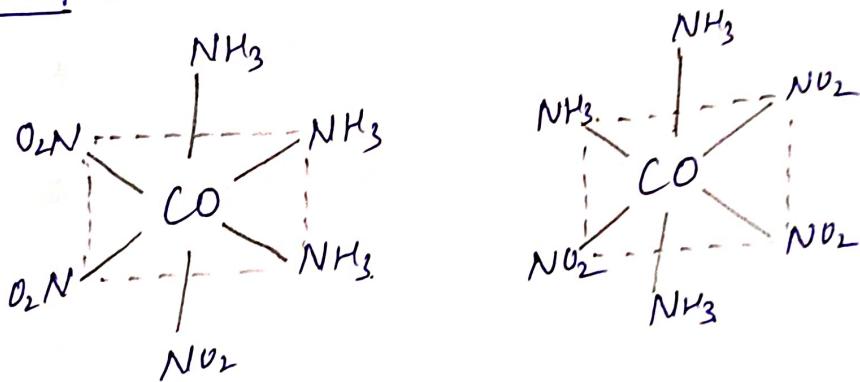

'cis' form

'trans' form.

b. The complexes of the type Ma_3b_3 type:

example: $[Co(CN)_{3}(NO_2)_3]$

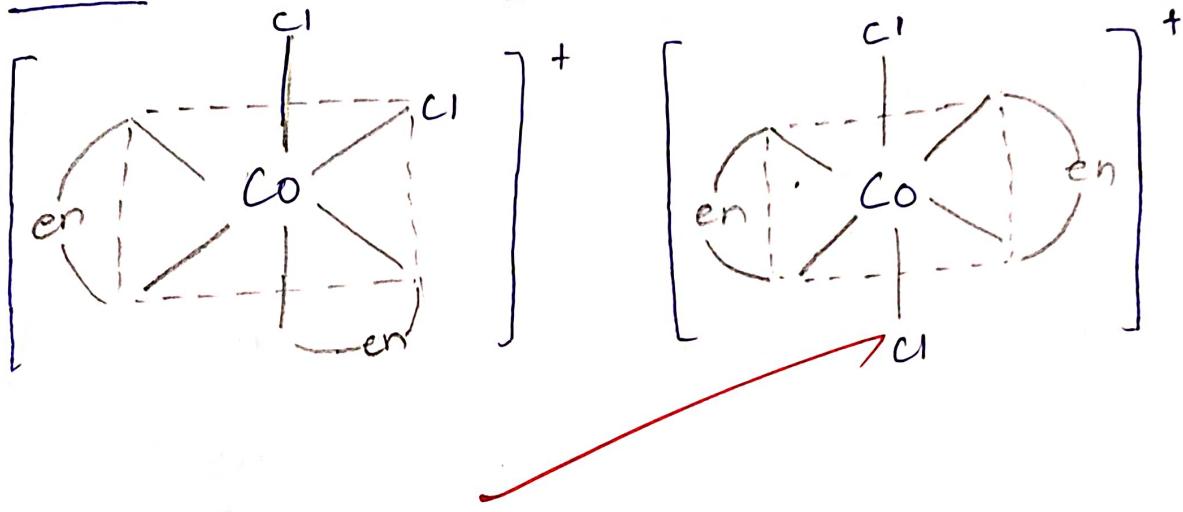

In this type of complexes, If the trio of ligands occupy the adjacent corner of an octahedral face. Then isomer is known as

'facial (fac) isomer'

c. complexes of the type $M(aa)_2b_2$:

These contains bidentate ligands (aa). Show geometrical isomerism.

example: $[CoCl_2(en)_2]$

2. Optical Isomerism:

There are certain substances which can rotate plane polarised light. These are called 'optically active' substances.

* Enantiomer :

The optically active isomers of a compound which rotate the plane polarised light equally but in opposite direction. Optical isomers are mirror images but that cannot be superimposed on one other. These are called 'Enantiomers'

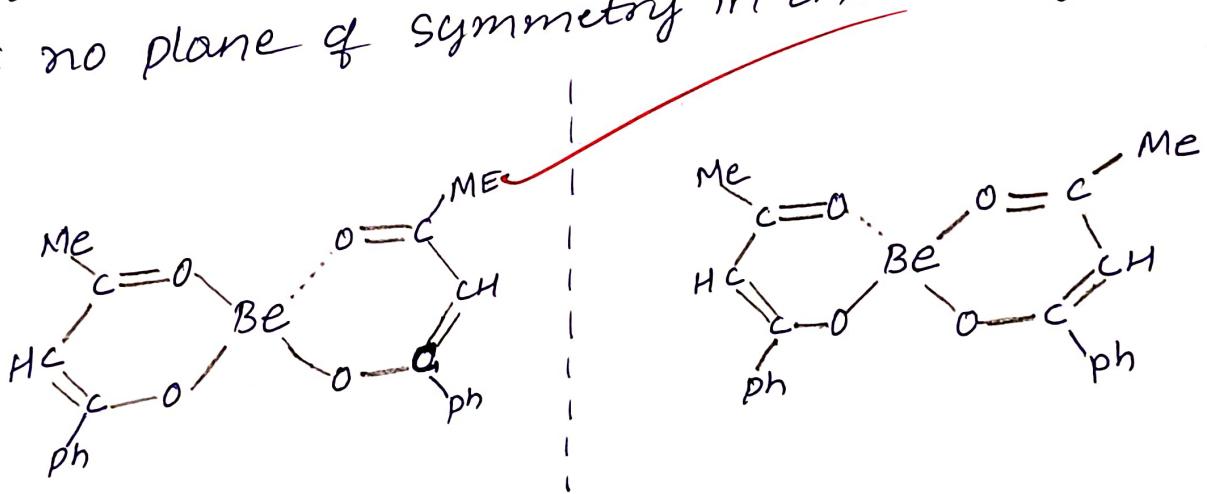

* Chiral :

The molecule/ion that cannot be superimposed are called 'chiral'.

The isomer which rotates the plane polarised light in the clockwise direction is called 'dextrorotatory' designed by (d) or (+). and which rotates plane polarised light in the anticlockwise direction is called 'laevorotatory' designed by (l) or (-).

Optical isomerism in complexes with co. number - 4.

Tetrahedral complexes with co. number 4 should exhibit optical isomerism. because there is no plane of symmetry in their molecules.

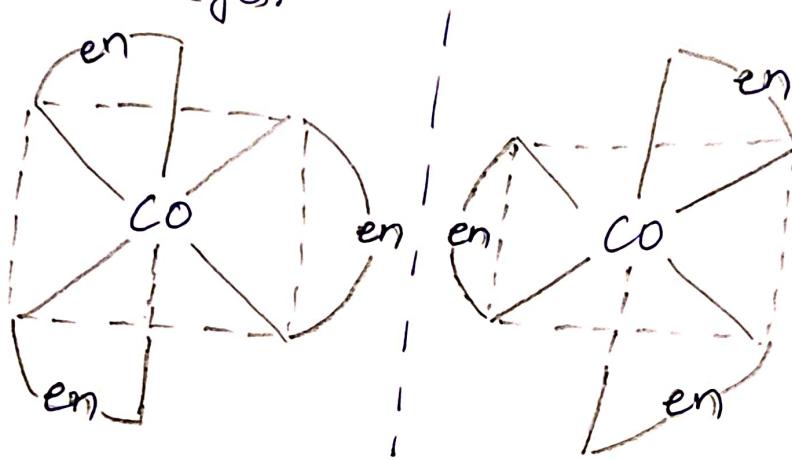

I may be noted that 4 different groups around the central metal atom are not essentially required for optical activity. All required molecule should be 'asymmetric' so that it can exist in two forms which are mirror images of each other. the two structures don't superimpose on each other.

Optical Isomerism in complexes with C.N = 6.

a). Complex of Type : $[M(aa_3)]$

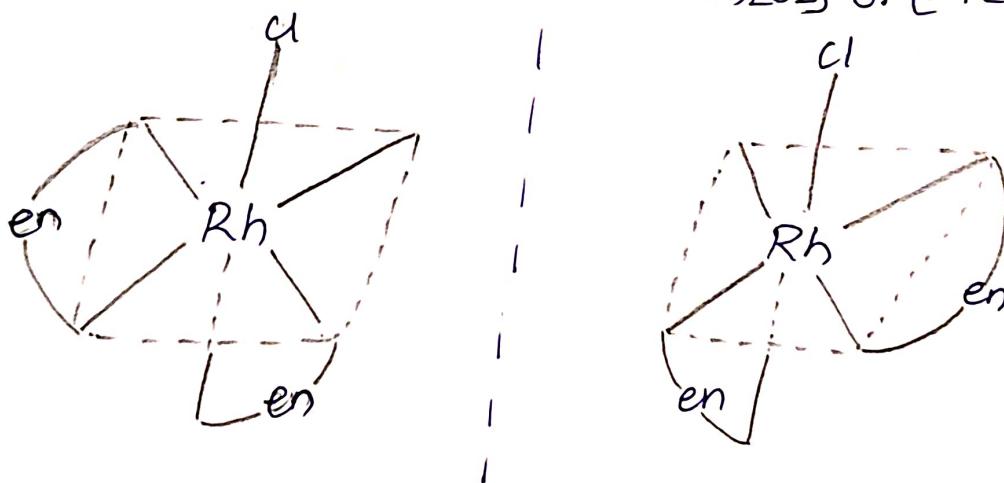

here (a.a) means bidentate ligand.

example: $[\text{Co}(\text{en})_3]\text{Cl}_3$, $[\text{Cr}(\text{ox})_3]^{3-}$ etc. exist as optical isomer. because they are non-superimposable mirror images.

Two Optical Isomer of complex $[\text{Co}(\text{en})_3]^{3+}$.

b). Complex of Type : $[M(aa_2b_2)]$ or $[M(aa)_2bc]$.

optical Isomers of cis $[\text{RhCl}_2(\text{en})_2]^+$

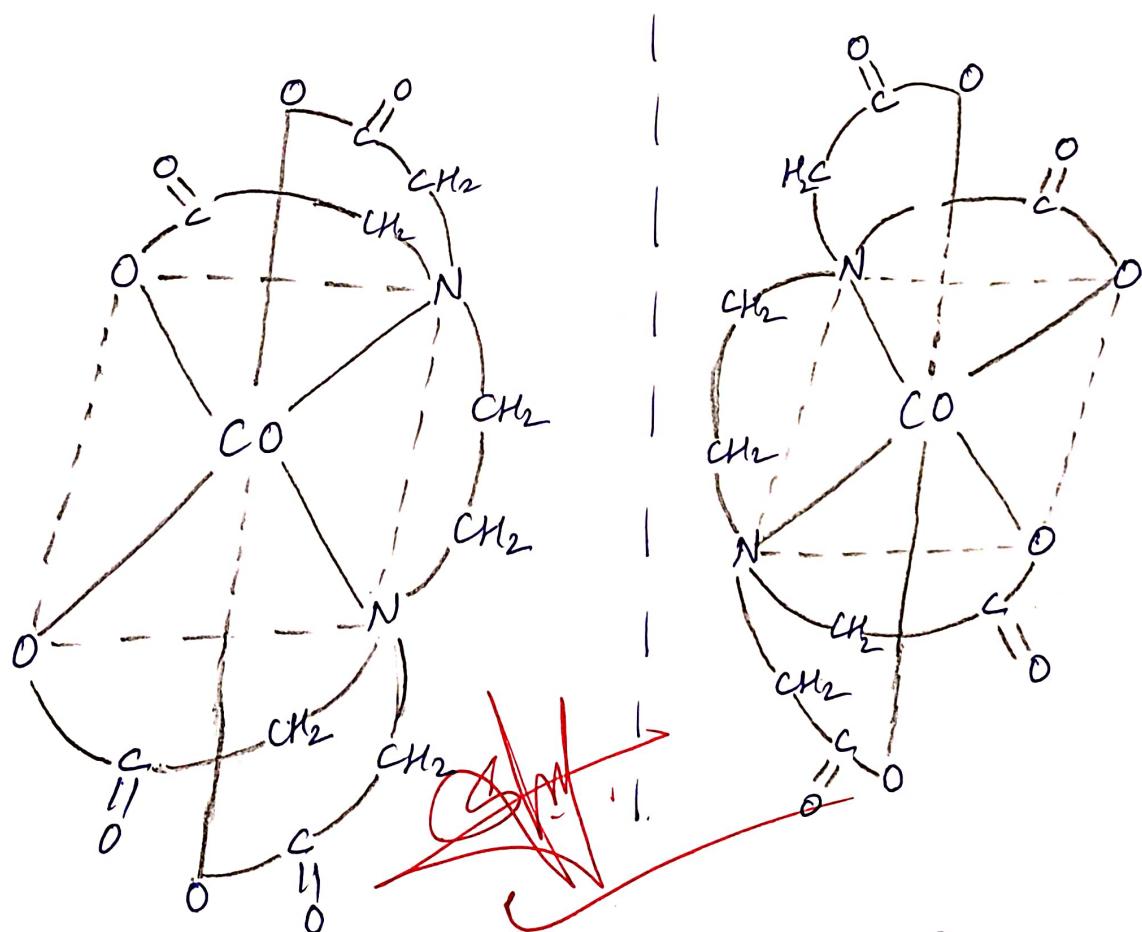

c.) complexes of the type: $[M(a_1a_2a_3)_b(b_1b_2)_c]$
example: $[\text{CoCl}_2(\text{en})\text{CNH}_3)_2]^+$ exists in both d & l form

d) complexes containing unidentate ligands: $[\text{Mabcdef}]$. These complex of type can theoretically 15 geometrically forms. each of them is optically active.

e). complexes containing hexadentate ligand:

The complex containing hexadentate ligand such as ethylenediaminetetraacetato (EDTA) also show optical activity.

example: $[\text{Co(EDTA)}]^-$ exist in 2 forms. they are both d & l. form.

Optical Isomers of $[\text{Co(EDTA)}]^-$

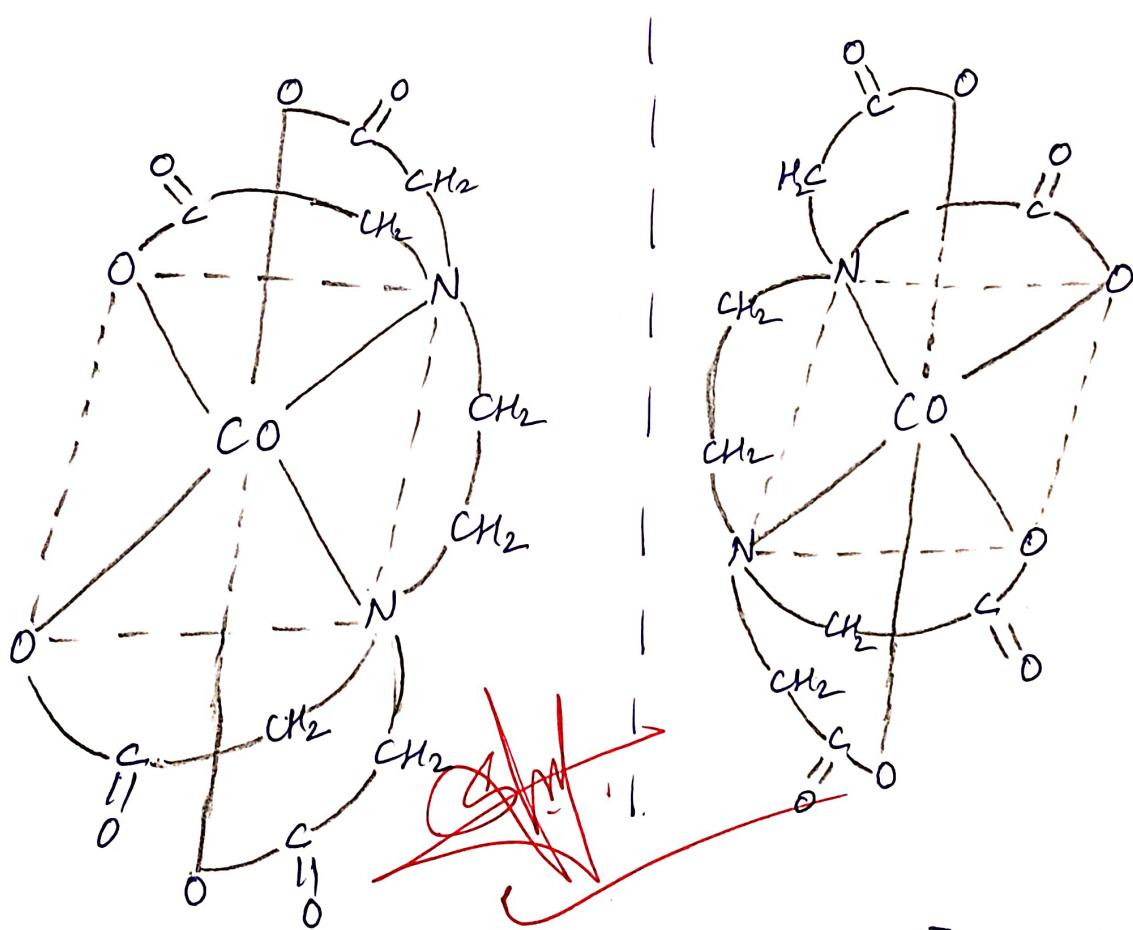

c.) complexes of the type: $[M(aa)b_2c_2]$
example: $[CoCl_2(\text{en})(\text{NH}_3)_2]^+$ exists in both d & l form

d) complexes containing unidentate ligands: $[Mabcdef]$. These complex of type can theoretically 15 geometrically forms. each of them is optically active.

e). Complexes containing hexadentate ligand:

The complex containing hexadentate ligand such as ethylenediaminetetraacetato (EDTA) also show optical activity.

example: $[\text{Co}(\text{EDTA})]^-$ exist in 2 forms. they are both d & l. form.

Optical Isomers of $[\text{Co}(\text{EDTA})]^-$

INTRODUCTION

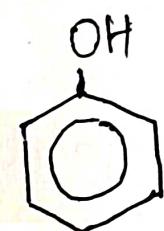

The class name 'phenol' is adopted from the name of the simplest member — the monohydroxybenzene (Greek: phene = benzene and ολ = OH).

They are generally occurring in coal tar, wood tar and petroleum distillate. As a class they occupy an important position in the modern synthetic organic chemistry for the preparation of dyes, antioxidants, phenolic resins and certain pharmaceutical products. A number of commercial synthetic processes have been recently developed for the production of phenol to meet its increased requirements.

The electronic structure of phenol can be represented as a resonance hybrid of the following canonical forms

which explains the activation of benzene ring as also the ortho-para directive influence of $-\text{OH}$ group on the entering electrophile

→ OH directly attached to the benzene ring
representing a phenol

DEFINITION: Ar-OH , in which the hydroxy group is directly attached to a carbon atom of the aromatic ring.

Nomenclature

(1) Many phenols are known by distinctive trivial names.

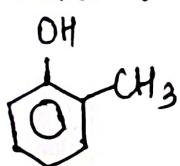

They have been given common names.

For example; the hydroxy derivatives of toluene have been given common name Cresole.

(2) Phenols are generally named as derivatives of the simplest member phenol. In doing so, the number 1 is assigned to the carbon bearing the OH group.

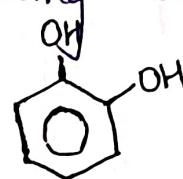

(3) When a phenolic moiety is included in a compound that is named by IUPAC system, the hydroxy group is specified as a substituent according to the order of precedence. In such a case a substituent (COOH or CHO) is assigned number '1.'

The nomenclature of phenols including systematic and common names is illustrated by the following examples:

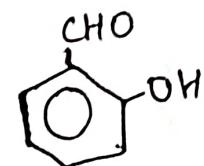

2-methylphenol

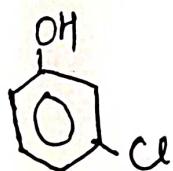

1-hydroxy-2-methylbenzene
o-cresol

1,2-dihydroxybenzene
catechol

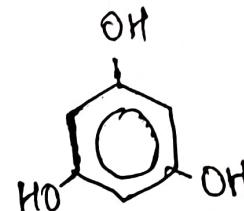

2-hydroxybenzaldehyde

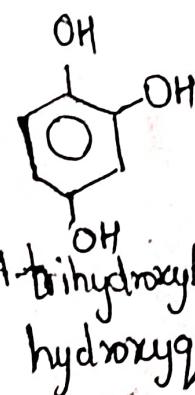

3-chlorophenol

3-chloro-1-hydroxybenzene

m-chlorophenol

1,3,5-trihydroxybenzene
phloroglucinol

1,2,4-trihydroxybenzene
hydroxyquinone

④ The prefixes ortho (o-), meta (m-) and para (p-) are used in place of numbers or positions 2, 3 and 4 respectively while naming monohydric substituted phenols or hydroxytoluenes.

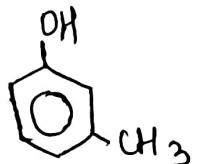

Classification

Phenols are classified into monohydric, dihydric and trihydric phenols according to ⑩ on the number of hydroxy groups present on the benzene ring.

1) MONOHYDRIC PHENOLS:

They contain only one hydroxy group on the benzene ring.

Example:

3-methylphenol

1-hydroxy-3-methylbenzene
m-cresol

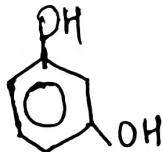

phenol

2) DIHYDRIC PHENOLS:

They contain two hydroxy groups on the benzene ring

Example:

1,3-dihydroxybenzene
resorcinol

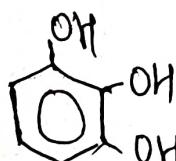

1,4-dihydroxybenzene
hydroquinone

3) TRIHYDRIC PHENOLS:

They contain three hydroxy groups on the benzene ring.

Example:

1,2,3-trihydroxybenzene
pyrogallol

Methods of Preparation

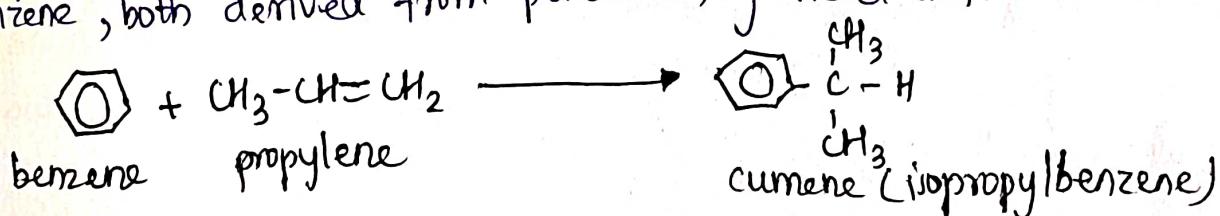

Even though there are several laboratory preparation methods as well as large scale commercial ones, we will discuss 3 major methods of preparation namely;

- (a) From Cumenes
- (b) By Dow's Process
- (c) From Diazonium salts

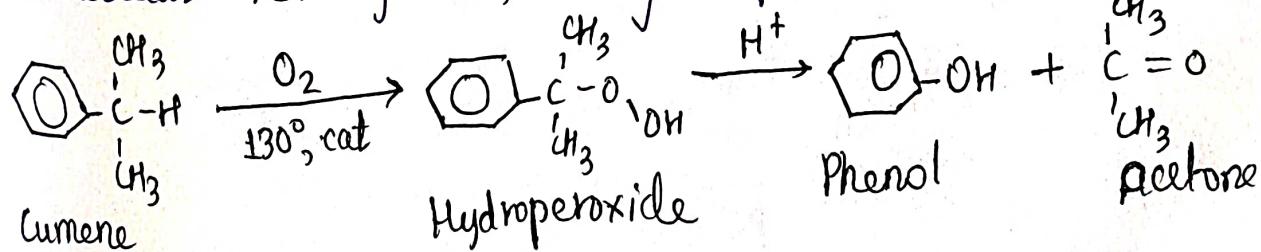

From Cumenes

The most recent commercial synthesis of phenol involves 2 steps:

1) Preparation of isopropylbenzene or cumene from propylene and benzene, both derived from petroleum, by Friedel-Crafts Reaction

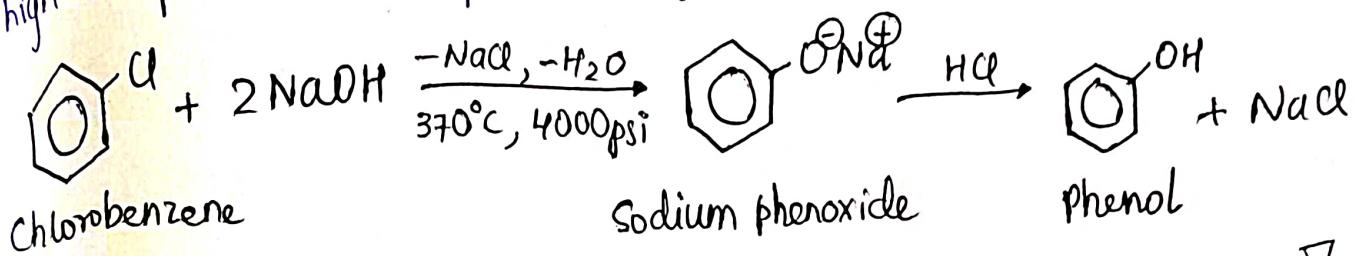

2) Cumene is then oxidised by oxygen at 130°C in the presence of a metal catalyst (or initiator) which yields cumene hydroperoxide. Treatment of the hydroperoxide with dilute sulphuric acid induces a molecular rearrangement, leading to phenol and acetone.

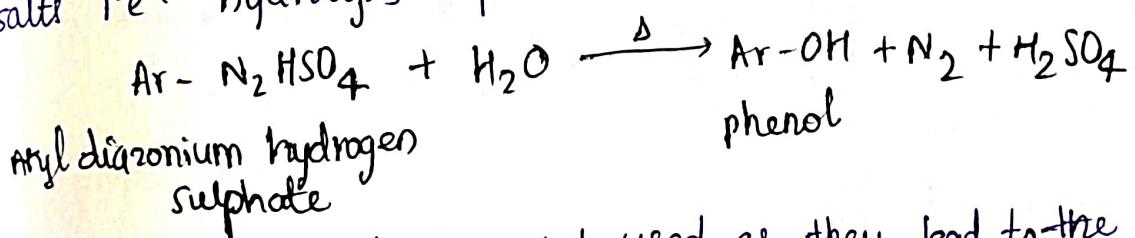

Dow's Process

Aryl halides yield phenol when hydrolysed with aqueous sodium hydroxide. For example: Chlorobenzene is hydrolysed to phenol at high temperature and pressure by NaOH.

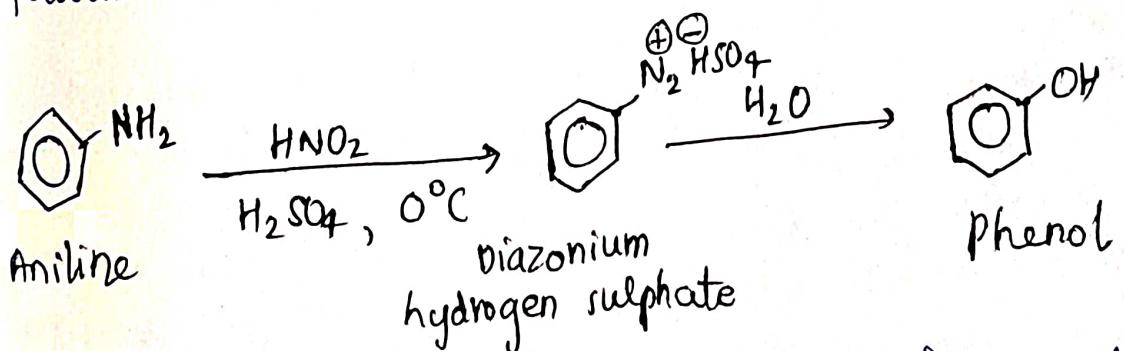

Diazonium Salt

Phenols can be obtained by heating aqueous solutions of diazonium salts i.e. hydrolysis of diazonium salts

Diazonium chlorides are not used as they lead to the formation of byproducts (e.g.: ArCl). For example: Phenol is obtained from aniline as follows:

It is a valuable method for making phenols from aryl amines produced by nitration and reduction of arenes.

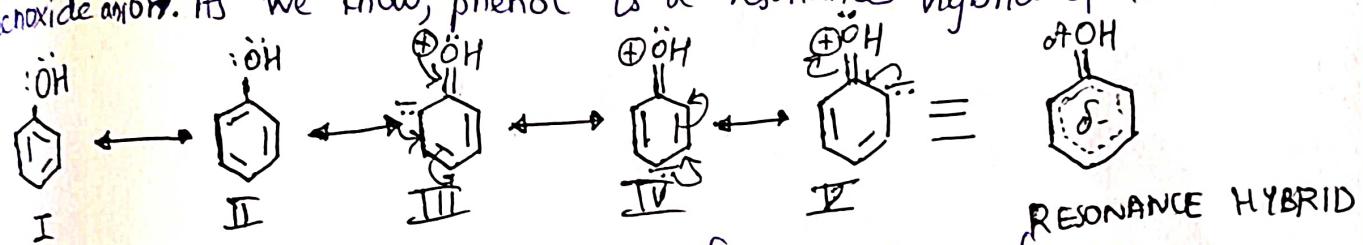

Acidity

The acidity of a compound is defined as its proton-releasing ability in the presence of water. (Lewis base). Phenols behave as weak acids because they ionise when dissolved in water, to form phenoxide ions.

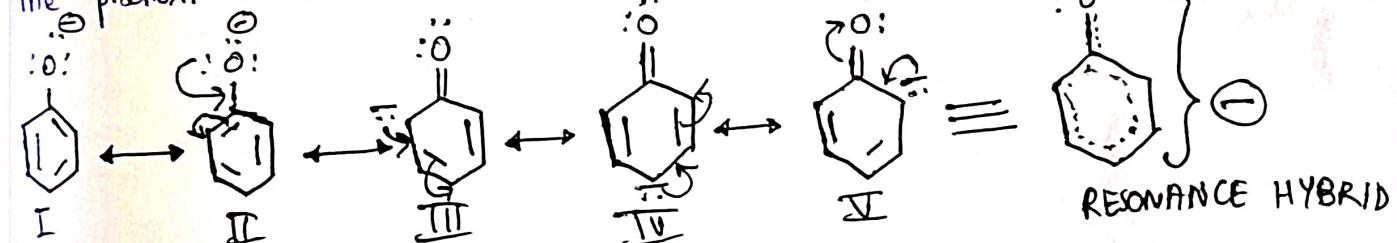

Thus,

phenols are markedly more acidic than alcohols, although less so than carboxylic acids. This is evident from the values of K_a given; 1.3×10^{-10} . The ease with which a phenol gives/releases a proton, is explained by the difference in the resonance stabilisation of the phenol and its phenoxide anion. As we know, phenol is a resonance hybrid of five forms.

The phenoxide anion also occurs in five resonance

It may be noted that both phenol and phenoxide anion have 2 Kekulé forms. In addition, they have three other charged forms each with the negative charge on the ortho and para position. In phenol, these charged forms (III and V) contribute much less to the hybrid than do Kekulé forms (I and II). This is so because charge separation costs energy and high-energy forms cannot stabilise the hybrid much. The resonance forms of the phenoxide ion in which the charge is in the ring, however, acquires no charge separation. The charge is only delocalised. Hence, these forms (III to V) stabilise the phenoxide anion very much. Thus, relatively the resonance hybrid of phenoxide anion is much more stable than the resonance hybrid of phenol itself.

phenol hybrid

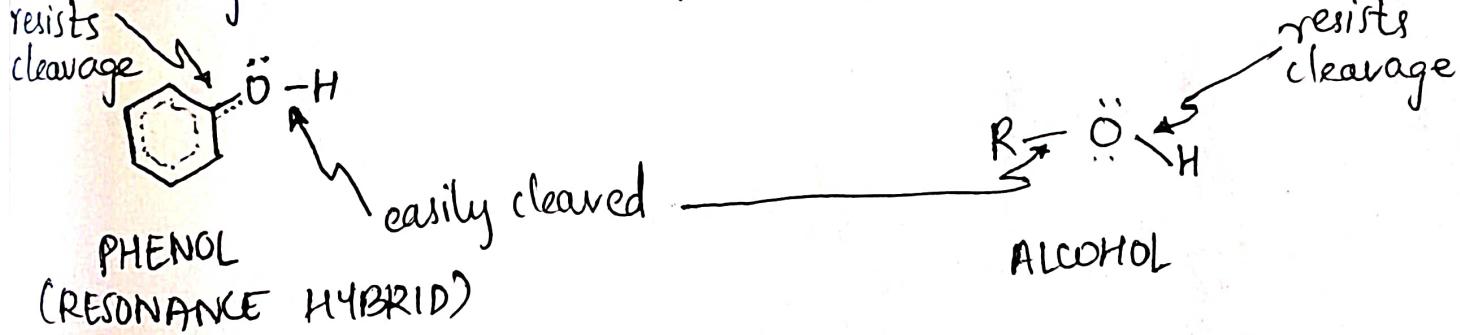

Phenoxide anion hybrid (more stable)

Since phenoxide anion hybrid is more stable than the phenol hybrid, the equilibrium is displaced to the right, releasing H^+ ions. This explains why phenols can behave as acids.

COMPARISON OF ALCOHOL AND PHENOL ACIDITY

Phenols and alcohols are both made of a carbon framework carrying a hydroxy group, but they differ significantly in their chemical reactions. This is attributed to the structural difference between the two classes of compounds.

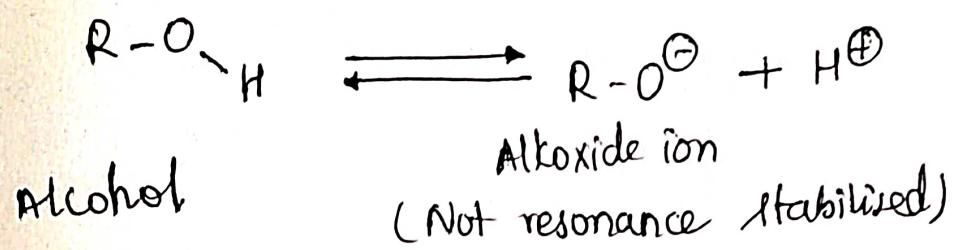

A non-bonded electron pair of oxygen atom of the phenolic OH interacts with the π system of the benzene ring and is delocalised. The delocalised electrons now belong to all the six carbons of the ring as also to the oxygen atom. This delocalisation of non-bonded electrons caused by resonance is represented by the hybrid structure of phenol given below. As a result of delocalisation of electrons as shown below, the C-O bond acquires some double bond character and becomes stronger than O-H bond σ . Also, the increased electron density in the benzene ring activates it, and gives electrophilic substitution reactions.

In alcohols, no resonance is obviously possible and the non-bonded pairs of electrons remain localised on the oxygen atom. The C-O linkage thus retains its σ bond character and is weak as compared to that in phenols.

Thus, while alcohols give reactions in which OH group is replaced by other substituents (C-O cleavage), phenols do not do so normally. On the other hand, phenols are dissociated at the O-H bond and behave as weak acids, forming salts with alkalis. Alcohols do not form salts with alkalis.

Alcohols are 'neutral' in the sense that their acidity is ($K_a \approx 10^{-18}$) no more than that of water ($K_w = 10^{-14}$). This is understandable because the formation of alkoxide anion is not favoured as it is not resonance stabilised.

Considering from another viewpoint, ionisation of both phenol and alcohol requires energy. But the ionisation of phenol would require smaller energy (ΔE_2) owing to the resonance stabilisation of phenoxide anion, than the ionisation of alcohols (ΔE_1) as the alkoxy anion is not resonance stabilised. That is why the ionisation of phenol is favoured greatly as compared to that of phenols. Or, phenol is much more acidic than alcohols.

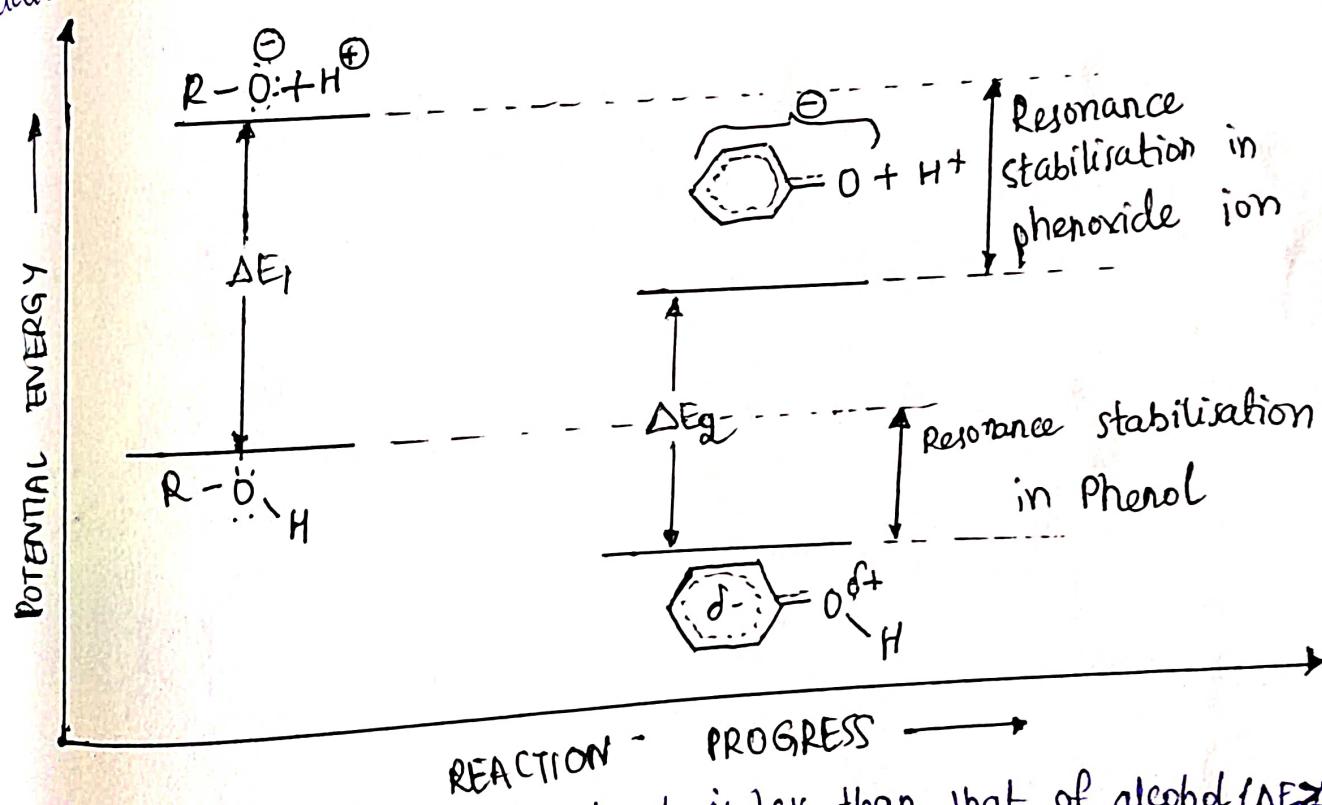

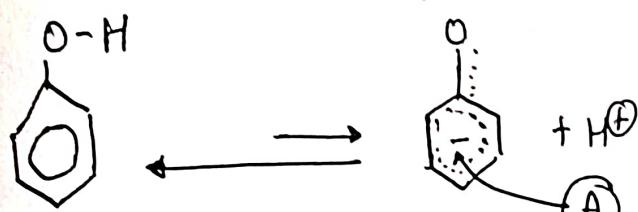

FIGURE: Ionisation energy of phenol is less than that of alcohol ($\Delta E_2 < \Delta E_1$) due to resonance stabilisation in phenol and phenoxide, favouring the former reaction.

EFFECT OF SUBSTITUENTS ON ACIDITY OF PHENOLS:

ELECTRON DONATING GROUPS:

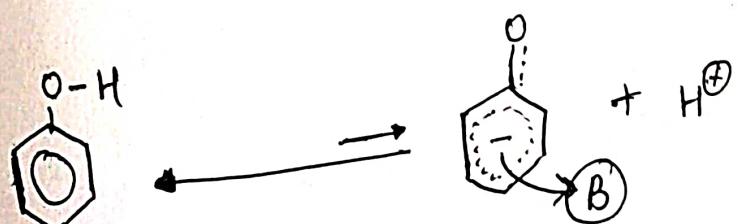

(i) $-\text{CH}_3$, $-\text{OCH}_3$, $-\text{NH}_2$ are some electron donating/releasing groups. An electron releasing substituent 'A' (say $-\text{CH}_3$) pumps electrons into the benzene system and intensifies the negative charge of the phenoxide anion. This makes the anion less stable, thereby decreasing the acidity of the phenol.

'A' pumps electrons into the ring, strengthens the negative charge on phenoxide anion and destabilises it, decreasing acidity of phenol.

ELECTRON WITHDRAWING GROUPS:

(ii) $-\text{NO}_2$, $-\text{Cl}$, $-\text{CN}$, $-\text{CHO}$, $-\text{COOH}$ etc are some electron withdrawing groups. An electron withdrawing substituent 'B' (X , NO_2 , CHO , COOH) withdraws electrons from the ring system which results in the dispersal of the negative charge of the phenoxide anion. This stabilises the phenoxide anion. and therefore, the acidity of the phenol is increased.

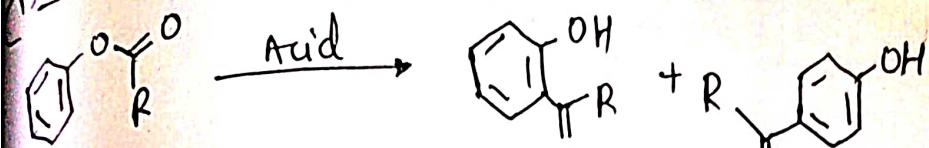

'B' withdraws electrons from the ring, thereby decreasing the negative charge of phenoxide anion and stabilising it, which enhances the acidity of phenol.

This also explains why methylbenzenes are less acidic than phenol, while chlorophenols are more acidic than phenol.

REARRANGEMENTS

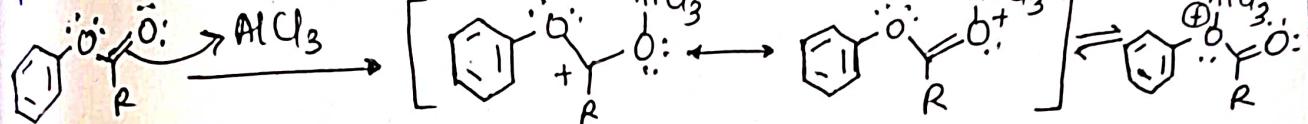

1) FRIES REARRANGEMENT REACTION:

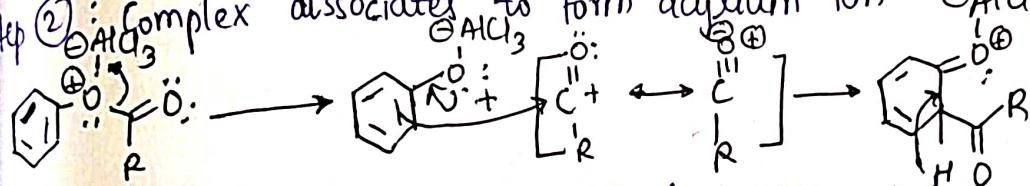

It enables the preparation of acyl phenols.

Mechanism:

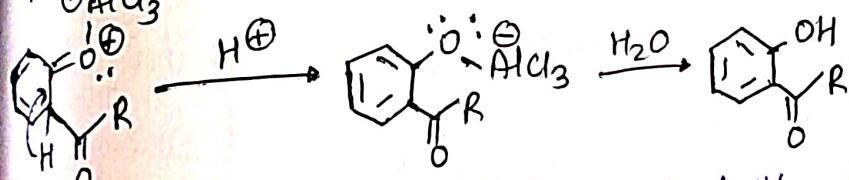

Step ①: Reaction is catalysed by Brønsted or Lewis acids like AlCl_3 , HF etc.

Step ②: Complex dissociates to form acylium ion $\text{C}(=\text{O})^+$ and AlCl_3 .

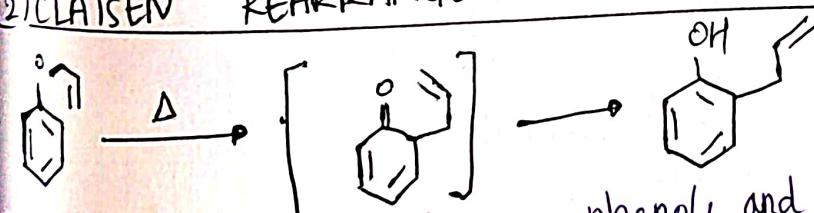

Step ③: After hydrolysis, the product is liberated.

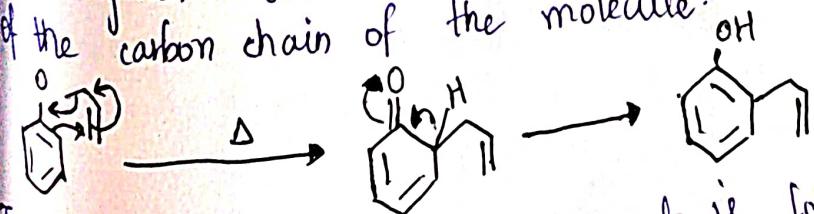

Reaction is ortho-, para-selective so that the site of acylation can be regulated by choice of temperature.

2) CLAISEN REARRANGEMENT REACTION:

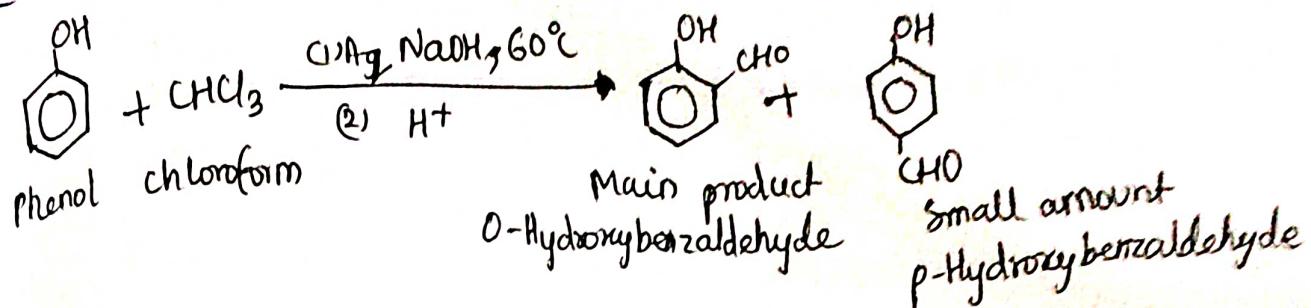

The etherification of alcohols or phenols and their subsequent Claisen rearrangement under thermal conditions makes possible an extension of the carbon chain of the molecule.

The aromatic Claisen rearrangement is followed by rearomatization.

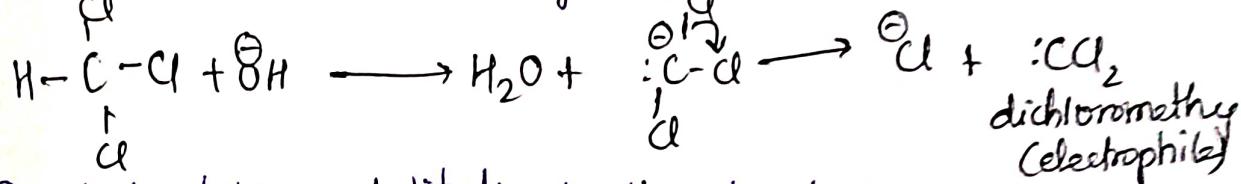

3) REIMER TEPLITZIEMANN REACTION:

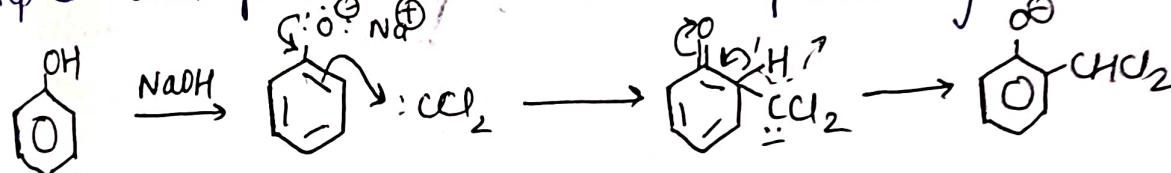

The treatment of a phenol with chloroform (CHCl_3) and aqueous NaOH at 60°C , followed by acidification, introduces a $-\text{CHO}$ group in the aromatic ring mainly in the ortho position to OH group.

Mechanism:

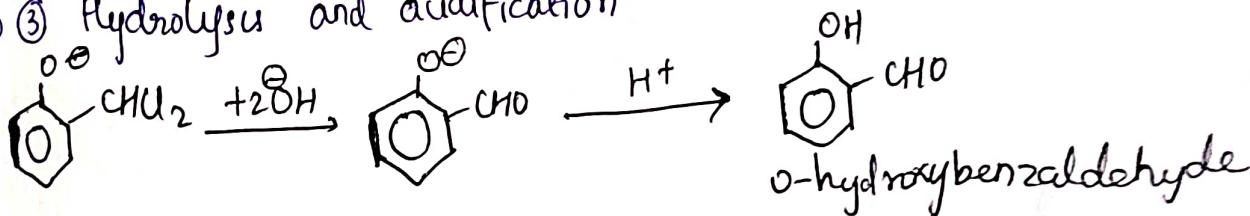

Step ① Formation of dichloromethylene (dichlorocarbene) from chloroform

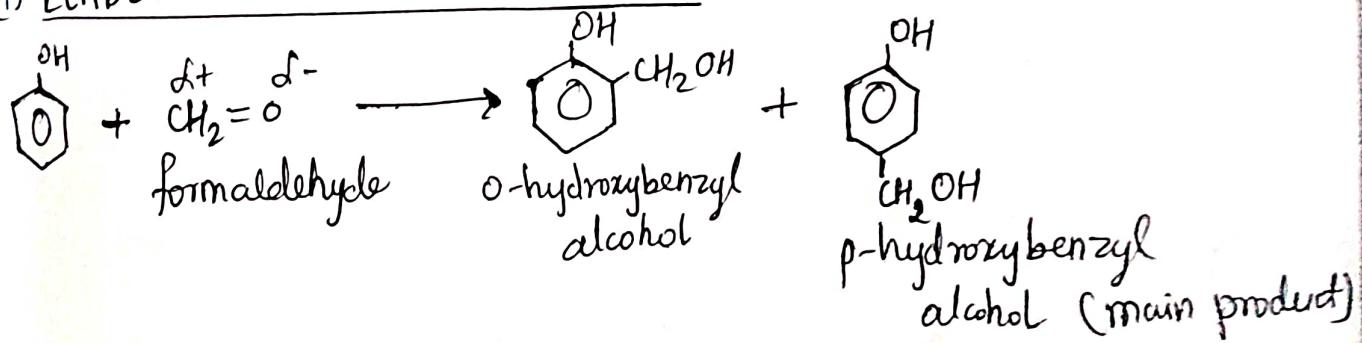

Step ② Electrophilic substitution in the phenol ring

Step ③ Hydrolysis and acidification

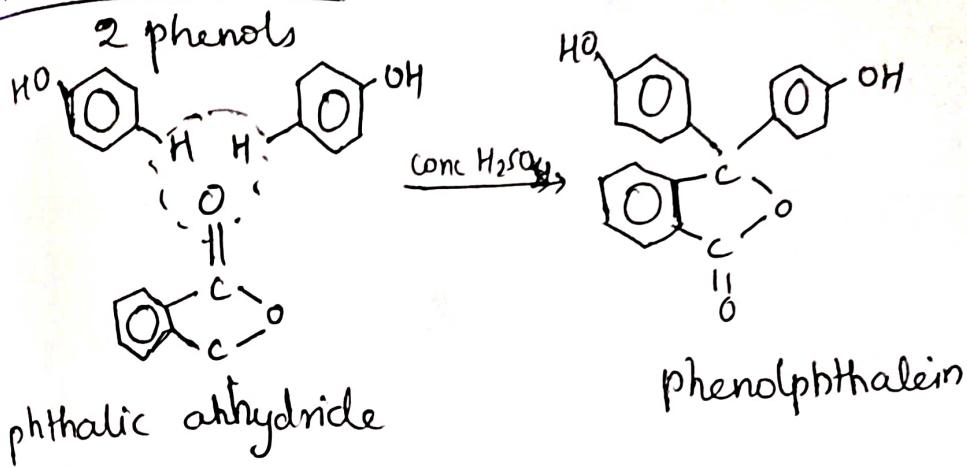

4) LEADER - MANASE REACTION:

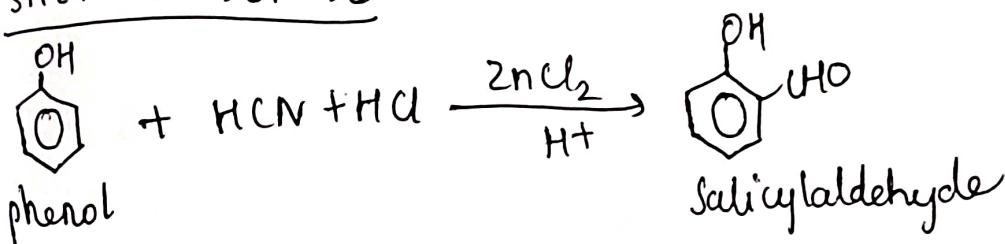

Phenols undergo condensation with aldehydes by electrophilic substitution in ortho and para positions in presence of acids or alkalis as catalyst.

Synthesis

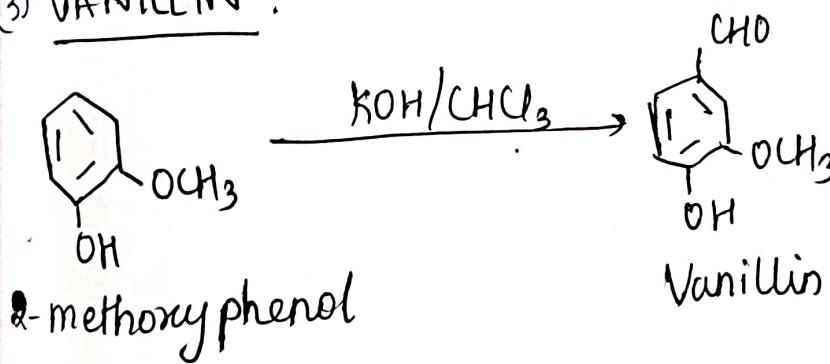

1) PHENOLPHTHALEIN :

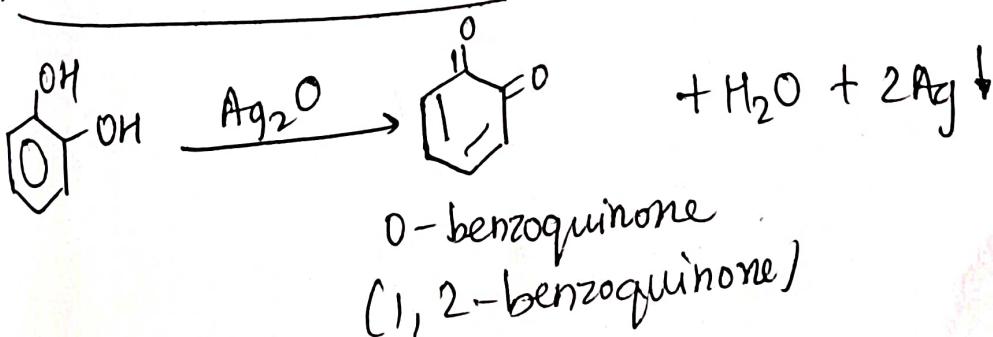

2) SALICYLALDEHYDE :

3) VANILLIN :

4) O - BENZOQUINONE :

CATALYSIS

Introduction:

The term catalysis is introduced by J J Berzelius (1835) to describe the influence of a foreign of a substance on the rate of reaction. The foreign substances was called a catalyst. A catalyst influences the rate of a reaction, itself remaining chemically and quantitatively unchanged. It can accelerate or retard the reaction. The term catalyst is used generally to express acceleration. According to Ostwald (1895), a catalyst is defined as a substance that changes the reaction rates without affecting the overall energetics of the reaction.

Definition:

A catalyst is defined as a substance which alters the rate of a chemical reaction, itself remaining chemically unchanged at the end of the reaction. This process is called catalysis.

Types of Catalysts:

They are classified as.

1. Homogeneous catalysis
2. Heterogeneous catalysis.

1. Homogeneous catalysis:

All such process, in which the catalyst, the reactants and the products are in the same phase are termed as homogeneous catalysis.

CATALYSIS

Introduction:

The term catalysis is introduced by JJ Berzelius (1835) to describe the influence of a foreign of a substance on the rate of reaction. The foreign substances was called a catalyst. A catalyst influences the rate of a reaction, itself remaining chemically and quantitatively unchanged. It can accelerate or retard the reaction. The term catalyst is used generally to express acceleration. According to Ostwald (1895), a catalyst is defined as a substance that changes the reaction rates without affecting the overall energetics of the reaction.

Definition:

A catalyst is defined as a substance which alters the rate of a chemical reaction, itself remaining chemically unchanged at the end of the reaction. This process is called catalysis.

Types of Catalysts:

They are classified as.

1. Homogeneous catalysts
2. Heterogeneous catalysts.

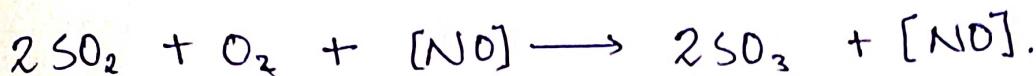

1. Homogeneous catalysts:

All such process, in which the catalyst, the reactants and the products are in the same phase are termed as homogeneous catalysts.

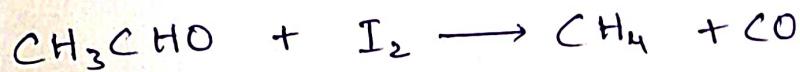

This type of catalysis can occur in gas phase or the liquid phase.

Examples of Homogeneous catalysts in gas phase.

(i) Oxidation of sulphur dioxide to sulphur trioxide with nitric oxide as catalyst.

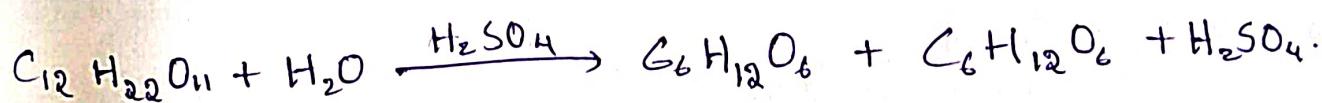

(ii) Decomposition of acetaldehyde with iodine as catalyst.

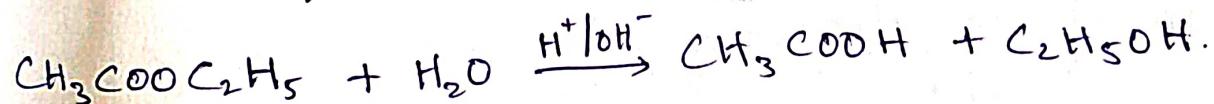

Examples of Homogeneous catalysts in liquid phase.

(i) Hydrolysis of cane sugar in aqueous solution in the presence of mineral acid as catalyst.

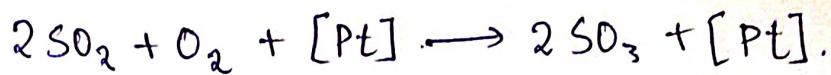

(ii) Hydrolysis of an ester in the presence of acid or alkali

Heterogeneous catalysts :

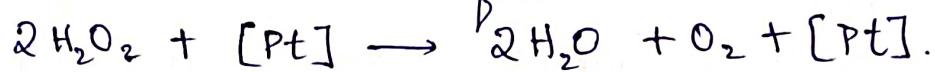

Heterogeneous catalysts is the type of catalysts where the phase of the catalyst differs from the phase of the reactants. The catalyst employed in all cases is a solid and reactants are either gases or liquids.

Example of Heterogeneous catalysis with reactants in gas phase.
is combination of sulphur dioxide and oxygen in the presence of finely divided platinum or Vanadium pentoxide!

Example of Heterogeneous catalysis with reactants in liquid

i) The decomposition of aqueous solution of hydrogen peroxide is catalysed by manganese dioxide or platinum in colloidal form.

Example of Heterogeneous catalysis with reactants in solid phase

i) The decomposition of potassium chlorate is catalyzed by manganese dioxide.

Characteristics of catalytic reactions:

- (i) The catalyst remains unchanged in quantity and in its chemical nature at the end of the reaction.
- (ii) Only a little amount of a catalyst is sufficient to bring about a considerable extent of reaction.
- (iii) The catalyst cannot affect the position of equilibrium in a reversible reaction. Since the catalyst remains unchanged in a chemical reaction it contributes no energy to the system.
- (iv) The catalyst and the reaction initiation. For a reaction to occur, the final state should have lower free energy than the initial state, and since a catalyst does not contribute to the total energy of the system, a catalyst will not be able to start a reaction.

- (v) Action of a catalyst on a chemical reaction is specific, therefore, the mechanism and the nature of the products depend to a large extent on the nature of the catalyst.
- (vi) The temperature effects on the reaction rates remain unaltered even in the presence of a catalyst.

Theories of catalyst:

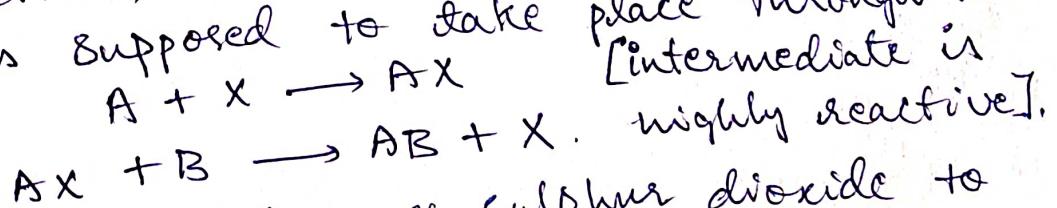

There are 2 main theories of catalytic reactions.

1. Intermediate compound formation theory
2. Adsorption theory for heterogeneous catalysts.

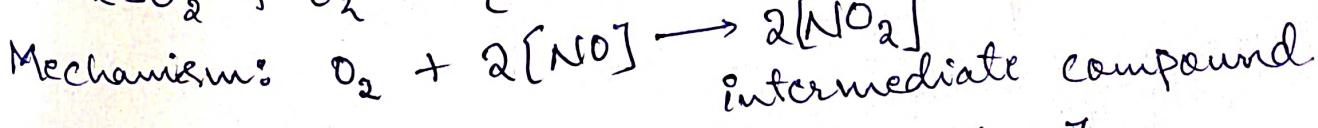

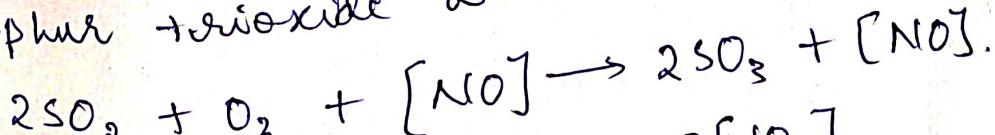

1. Intermediate compound formation theory:

According to this theory, the reaction is brought about by a path involving an intermediate formed from the catalyst and one of the reactants. This intermediate compound is highly reactive and reacts with the other reactants, or is unstable and decomposes to yield the products and releasing the catalyst.

For a reaction, $A + B \xrightarrow{X} AB$ (X is catalyst).
The reaction is supposed to take place through the reactions,

Example: Catalytic oxidation of sulphur dioxide to Sulphur trioxide with nitric oxide as catalyst.

2. Adsorption theory for heterogeneous catalysis:
Heterogeneous catalytic reactions generally proceed through adsorption of the reactants on the surface of the catalyst. This theory explains the mechanism of reaction between 2 gases catalysed by a solid.
Example $A + B \xrightarrow{\text{catalyst}} C + D$.

Mechanism Step 1: Adsorption of reactant Molecules on the solid surface. The reactant molecule A & B strikes the catalyst surface. They are held up at the surface by weak Van der Waal's forces.

Step 2: Formation of activated complex. The particles of the reactants join to form an intermediate complex which is unstable.

Step 3: Decomposition of activated complex. The activated complex breaks to form the products C and D. It was held by partial chemical bonds.

Step 4: Desorption of products from the catalyst surface. The particles of products are now stable and can lead an independent existence.

Enzyme catalysis:
Enzymes are protein molecules which act as catalyst to speed up organic reactions in living cells. The catalysis brought about by enzymes is known as enzyme catalysis.

Mechanism of enzyme catalysis:

Step 1: Binding of enzyme to substrate to form an activated complex

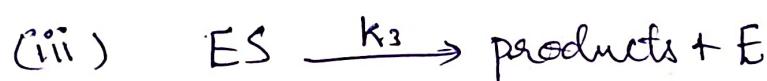

$$E + S \rightarrow ES^*$$

Step 2: Decomposition of the activated complex to form product.

Michaelis-Menten Equation:

The enzyme catalysis is believed to involve the reversible formation of an intermediate between the enzyme and the substrate. Followed by its decomposition into products and the enzyme.

The net rate of formation of intermediate ES is given by $\frac{d[ES]}{dt} = k_1[E][S] - k_2[ES] - k_3[ES]$.

Assuming a steady state condition for the intermediate ES i.e $\frac{d[ES]}{dt} = 0$.

$$[ES] = \frac{k_1[E][S]}{k_2 + k_3}$$

The rate of reaction is given by $R_t = \frac{d[\text{Product}]}{dt} = -\frac{d[ES]}{dt}$

From the reaction mechanism.

$$R_t = -\frac{d[ES]}{dt} = k_3[ES] = \frac{k_3 k_1 [E][S]}{(k_2 + k_3)}$$

E_0 is the initial concentration of the enzyme, then
 at any instant, $[E_0] = [E] + [ES]$
 $[ES] = [E_0] - [E]$
 $[E]_0 - [E] = \frac{K_1 [E][S]}{K_2 + K_3}$

$$[E] = \frac{E_0}{1 + \frac{K_1[S]}{K_2 + K_3}} = \frac{[E_0]}{1 + \frac{[S]}{K_2}}$$

The constant $K_2 = \frac{K_2 + K_3}{K_1}$ is called Michaelis constant.

$$R_t = \frac{K_3 K_1}{K_2 + K_3} \frac{[E_0][S]}{1 + \frac{[S]}{K_2}} = \frac{K_3 [E_0][S]}{K_2 + [S]}$$

If K_2 is small as compared to $[S]$ i.e all the enzyme is present in the form of complex, then its rate will be maximum and described as.

$$R_{\max} = K_3 [E]_0, \text{ then}$$

$$R_t = \frac{R_{\max} [S]}{K_2 + [S]} \quad \text{- Michaelis-Menten Equation.}$$

Michaelis constant is defined as the substrate concentration at half the maximum reaction velocity

$$R_t = \frac{R_{\max}}{2}$$

$$\frac{R_{\max}}{2} = \frac{R_{\max} [S]}{K_2 + [S]}$$

$$K_2 + [S] = 2[S]$$

$$K_2 = [S]$$

DIHYDRIC ALCOHOLS (Diols)

Introduction :-

Proper diols are dihydric alcohols having from two to six carbon atoms such as 1,3-propane diol and 1,4-butanediol. Glycols are dihydric alcohols that constitute an important class of organic compounds and are used widely in basic and applied research.

The IUPAC name of dihydric alcohols is called "diols". The common name of dihydric alcohols is glycols. The prefix Glycols = sweet since they have a sweet taste.

In diols the two -OH group may be present on the same carbon or different carbons. The dihydric alcohols having the -OH group to the same carbon are unstable and undergo spontaneous decomposition to yield a carbonyl compound.

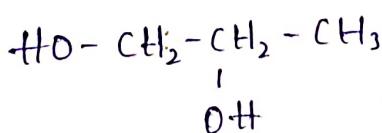

Nomenclature:-

The common names are assigned to individual diols after the name of the corresponding alkene or the polymethylene from which they could be obtained by direct hydroxylation.

Ex:- Alkane glycol or polymethylene glycols.

Ethylene glycol

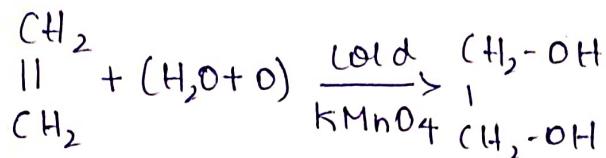

Propylene glycol

Preparation of Glycol from alkene:-

Hydroxylation of Ethylene:-

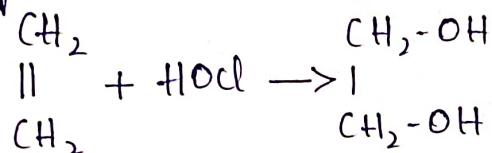

Ethylene glycol may be prepared by passing ethylene into cold dilute potassium permanganate solution.

Ethylene glycol.

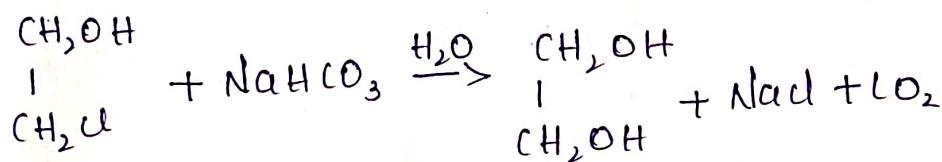

Hydrolysis of Ethylene chlorohydrin:-

Ethylene chlorohydrin required in the process is made by passing Ethene into aqueous hypochlorous acids.

Ethylene chlorohydrine

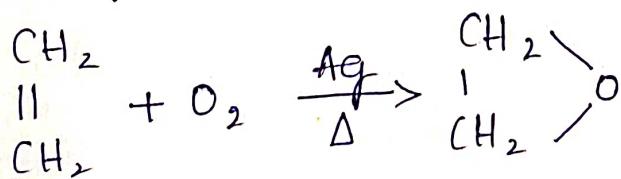

The Ethylene chlorohydrine undergo hydrolysis in the rows NaHCO_3 to produce ethylene glycol.

Ethylene glycol.

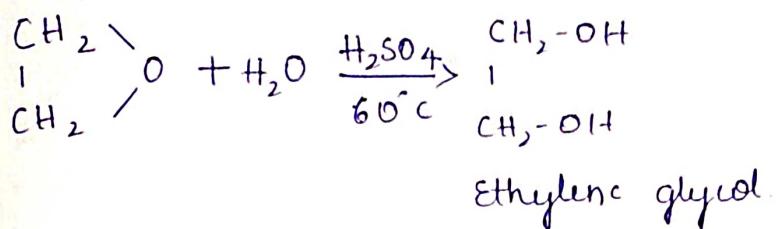

Hydrolysis of Ethylene oxide:-

Ethylene oxide is made by passing a mixture of Ethylene and oxygen over heated in silver catalyst

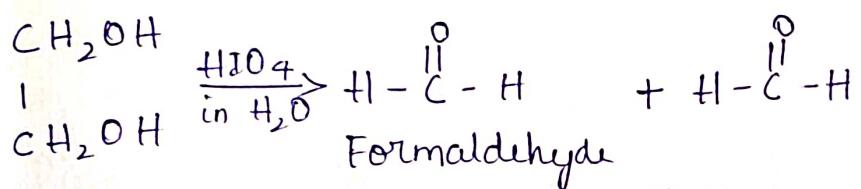

Ethylene oxide.

The hydrolysis of ethylene oxide with H_2O at 60°C in the presence of H_2SO_4 catalyst to give Ethylene glycol

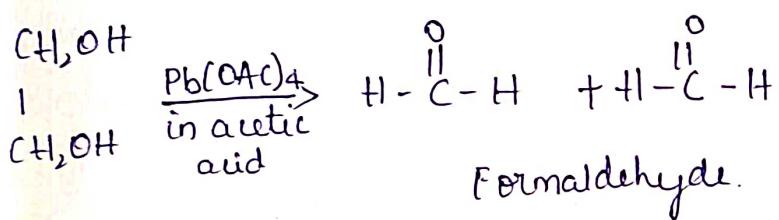

Oxidative cleavage of diols using lead tetra acetate and periodic oxide:

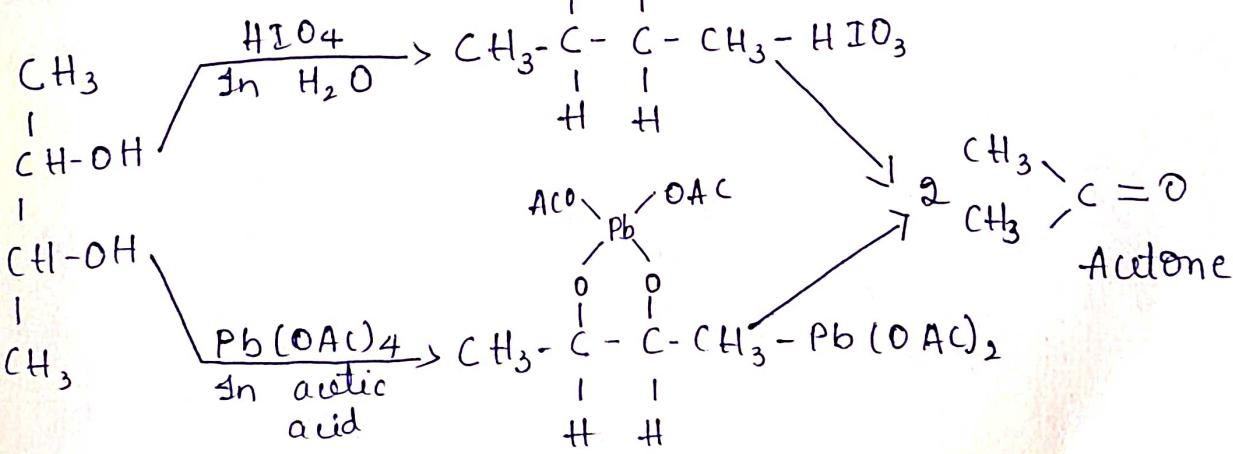

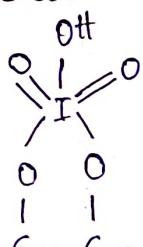

The oxidative cleavage of vicinal diols using periodic acid and lead tetra acetate to yield the aldehydes and ketones

The oxidative cleavage of ethylene glycol by periodic acid (HIO_4) in the presence of H_2O to give formaldehyde

The oxidative cleavage of ethylene glycol by lead tetra acetate in the presence of Acetic acid to yield two molecule of formaldehyde

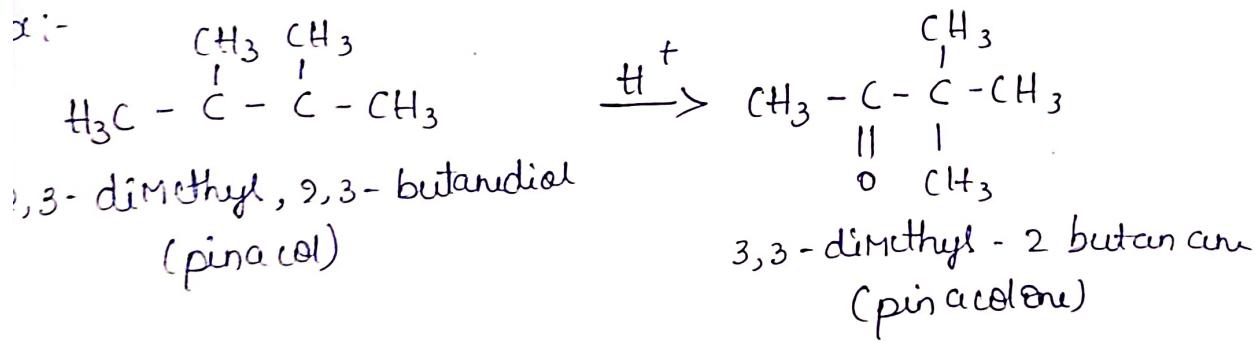

Uses of Ethylene Glycol:-

- As an Antifreeze in Automobile radiator because it forms low freezing mixture with water it is solid under the trade of prestone for this purpose.
- For preventing deposition and formation of ice on aeroplane wings.
- In making low freezing dynamite.
- As an coolant for Aeroplane engines.
- As a solvent and preservative.
- As plasticizer for viscose sugar crayon and as an intermediate in the manufacture of polythene polymers.
- For the preparation of Dioxane, diethylene glycol, ethylene dinitrate to ethylene glycol.
- As dielectric in electric condensers.

Pinacol - pinacolone Rearrangement:-

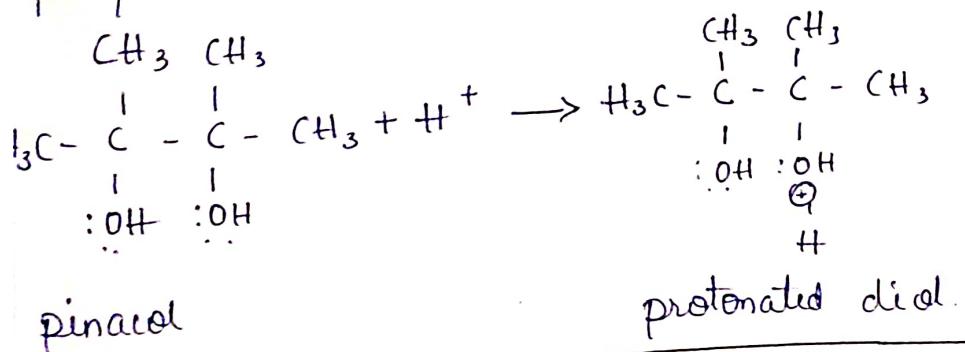

Completely substituted 1,2-diols such as 2,3-di Methyl, 2,3-butandiol are known as pinacols. They undergo dehydration & rearrangement in acid to form ketones this known as pinacol-pinacolone rearrangement reaction

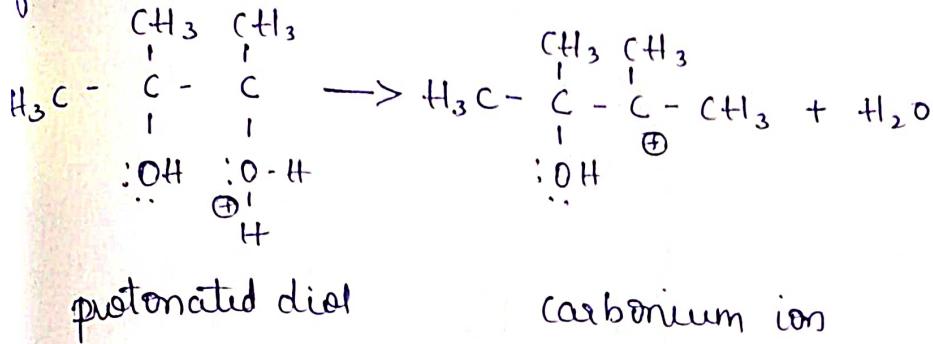

Mechanism:-

The mechanism of the above reaction involves the following steps.

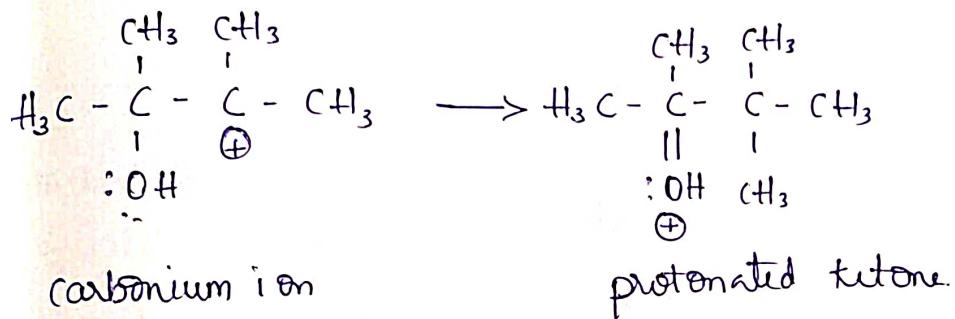

Step 1:- protonation of the 1,2-diol

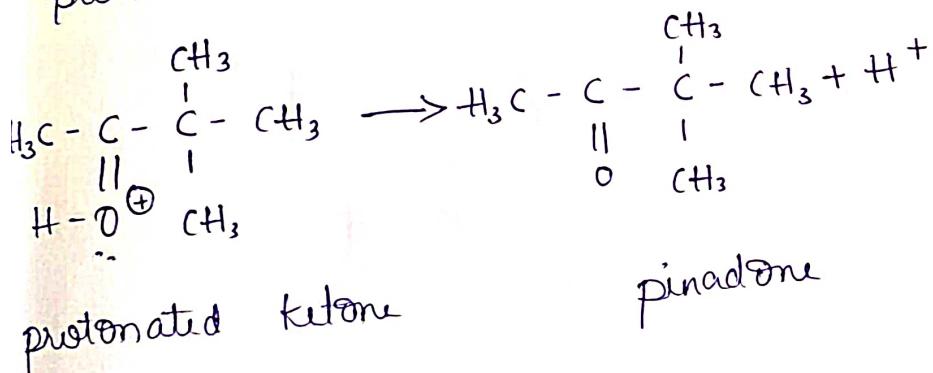

Step 2:- formation of carbonium ion by loss of water from the protonated diol

Step 3:- Rearrangement of carbonium ion by 1, 2-shift

Step 4:- Formation of ketone by loss of proton from the protonated ketone

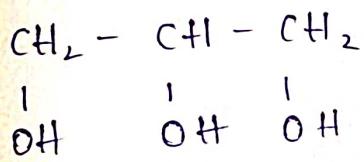

TRIHYDRIC ALCOHOLS

Introduction :-

Alcohol containing -OH group are called trihydric alcohols. The introduction of the third -OH group in a diol molecule raises the Boiling point by about 100°C and also increasing the viscosity. An increasing the number of -OH group also enhances the hydrogen bonding ability and association by raising the boiling point.

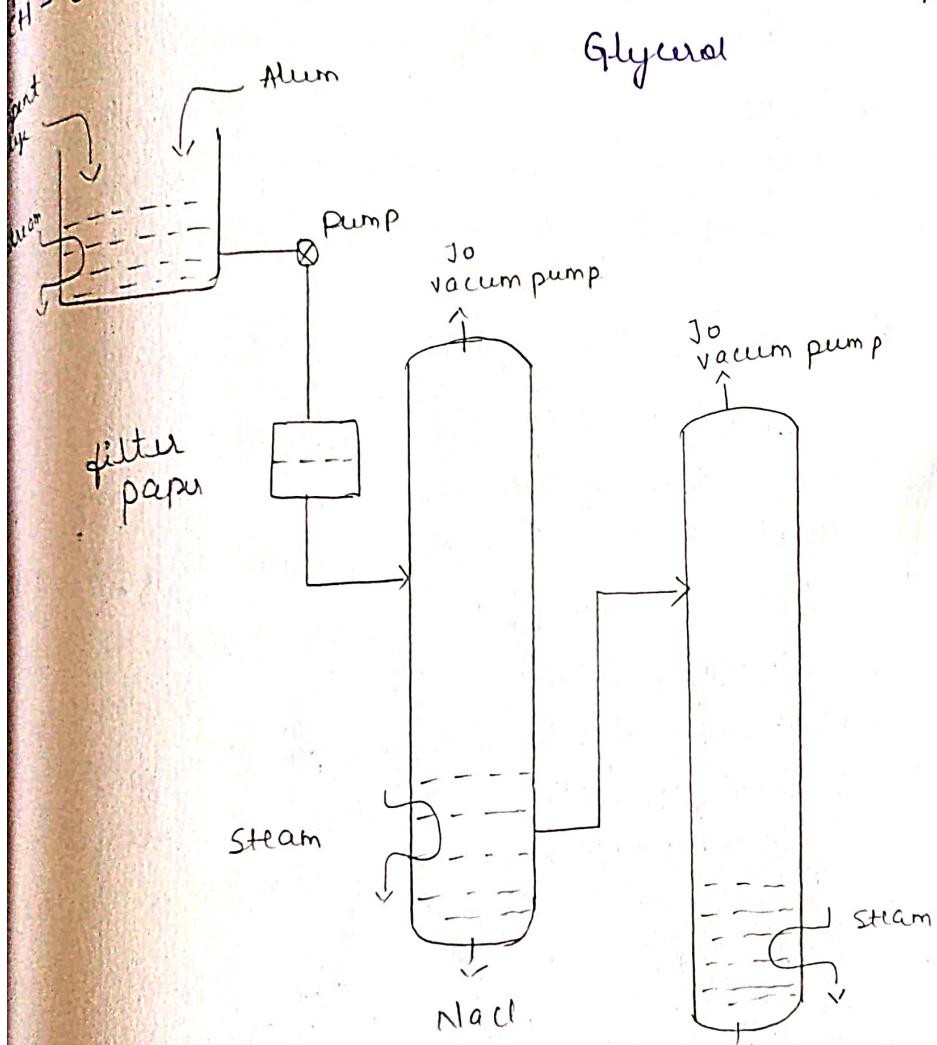

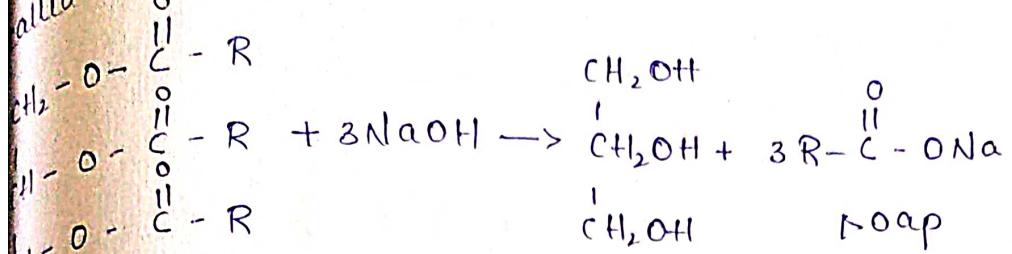

Nomenclature:-

Glycerol is the simplest trihydric alcohol (triol). Glycerol or glycine was originally derived from the name glycerol or glycine was originally derived from the word "glycerols" (sweet). Its IUPAC name is 1,2,3-trihydroxypropanetriol since glycerol should be considered as trihydroxy derivative of propane.

1,2,3-propane triol

Manufacture of Glycerol from spent lye:-
In soap manufacture, the fat is hydrolysed by boiling with alkali solution. The carboxylic acid produced by hydrolysis reacts with the alkali to form solid while the glycerol is left in the solution. The soap is filtered out. The filtrate is called as spent lye.

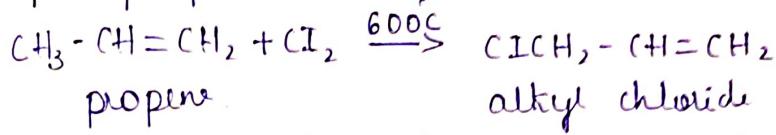

Spent lye contains 4 to 6% glycerol, unUsed alkali soluble soap. It is allowed to stand in a tank where suspended impurities settle down. The clear solution is then treated with steam to neutralize excess alkali. It is then treated with alum (Aluminium sulphate) and steam.

The remaining excess alkali is precipitated as aluminium hydroxide and the soluble soaps are converted into insoluble aluminium soaps. These impurities are filtered out. The filtrate is then concentrated under vacuum when most of the sodium chloride separates out. This is filtered and the filtrate is treated with animal charcoal to remove coloured impurities. After the filtration it is again obtained in 90% pure to obtain pure glycerol it is redistilled under vacuum until distillate has the specific gravity of 1.26.

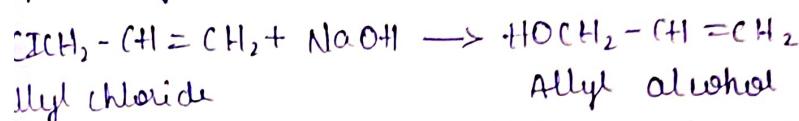

Preparation of propene:-

Large quantities of glycerol are obtained as by product in manufacture of soap. However, a by product supply is not sufficient, so much of glycerol is manufactured from propene obtained by the catalytic cracking of petroleum following 4 steps are involved.

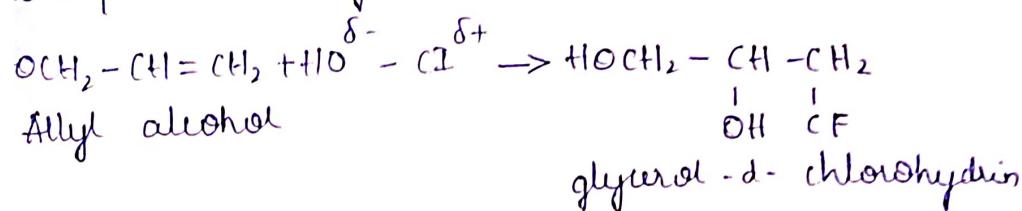

Step 1:- Propene is treated with Cl₂ at 600°C to give allyl chloride

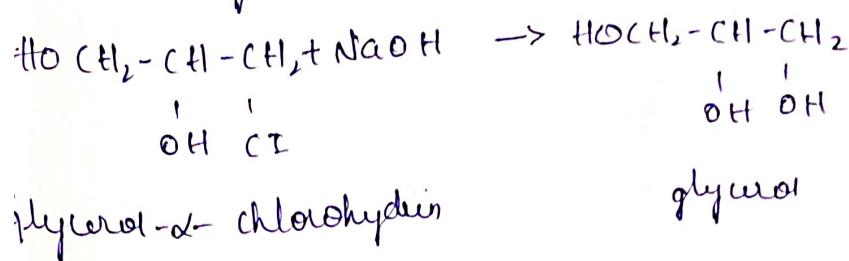

Step 2:- Allyl chloride is treated with dil NaOH gives allyl alcohol

Step 3:- Allyl alcohol is treated with hypochlorous acid to give a chlorohydrin the addition of HOCl to the carbon-carbon double bond takes place according to the markownikoff rule

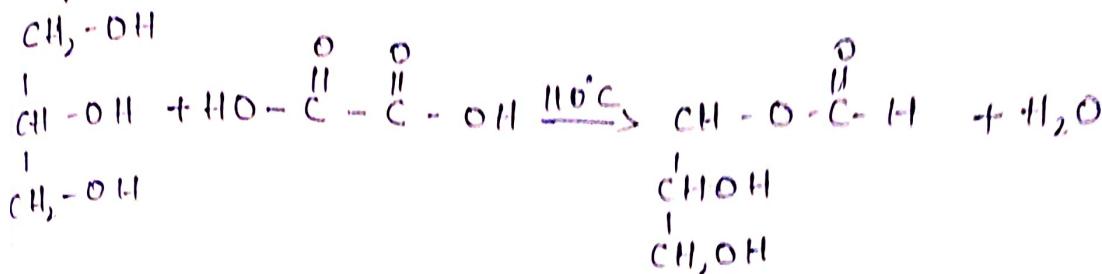

Step 4:- The chlorohydrin is treated with dil NaOH to yield glycerol

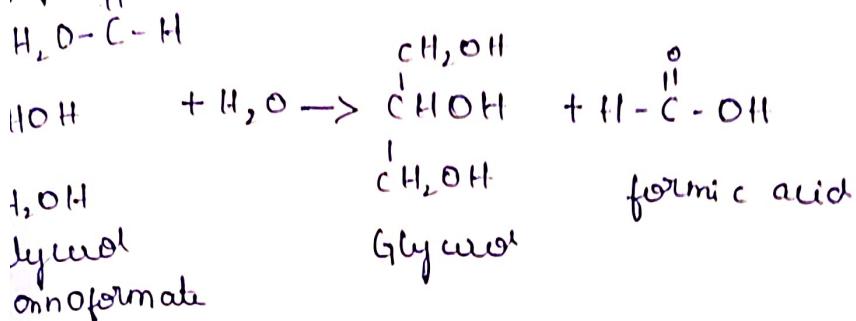

Reaction with oxalic acid at different temperatures.

Glycerol reacts with oxalic acid in two ways:-

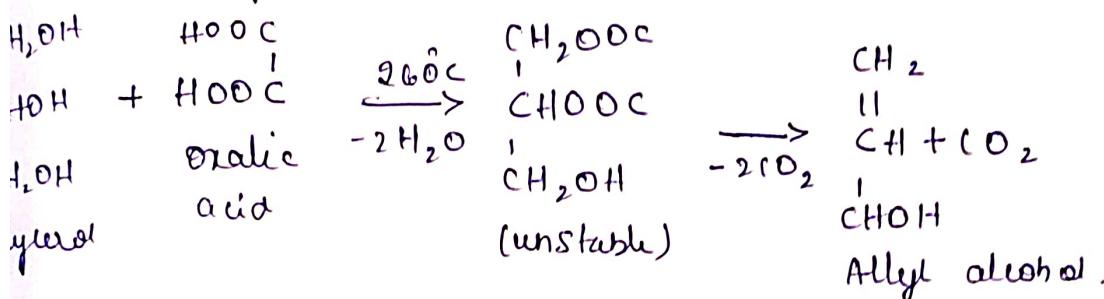

At 110°C glycerol reacts with oxalic acid to form glycerol monoformate.

Glycerol monoformate on hydrolysis gives formic acid & glycerol.

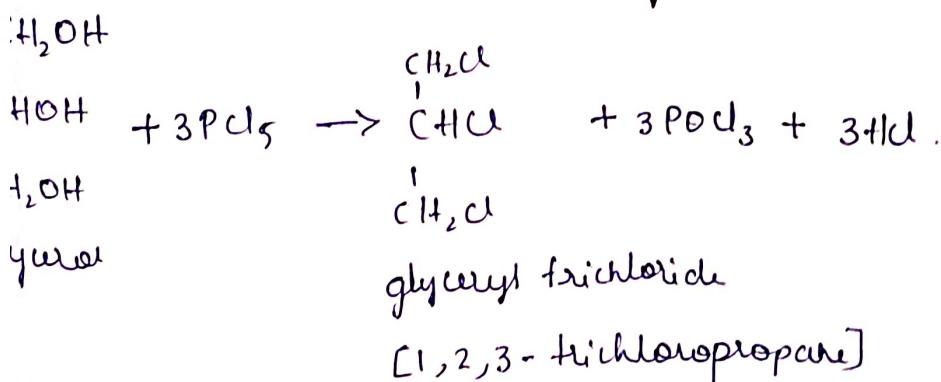

At 260°C glycerol reacts with oxalic acid to form allyl alcohol.

Reaction with PCl_5 -

Glycerol reacts with PCl_5 to form glycerol trichloride all three OH groups are replaced by Cl atom.

- Project Report

Project report is a means for communicating project work experience to others. A project report is a formal statement of the project process and its result. It narrates the problem studied, methods used for studying it and the findings and conclusions of the study.

A project report is a document which provides details on the overall picture of the proposed business. The project report gives an account of the project proposal to ascertain the prospects of the proposed plan/activity.

The General format of project report as follows :-

Project at Glance

Name of the Unit :- Shree company Ltd

Address for communication :-

New Tirthahalli Road

Near Shankara eye hospital

Shimoga

Karnataka 577201

Type of Unit :- Large Scale Industry

Name of Product :- Helmet

Partners name and address :-

1. Shreeraksha
2. Vanighree
3. Shreewathga

Production location :-

Industrial area
B.H Road
Shivammogga

History of product :-

The word helmet is diminutive from helm, a medieval word for protective combat headgear. The medieval great helm covers the whole head and often is accompanied with camail protecting throat and neck as well. Originally a helmet was a helm which covered the head only partly and protected it from injury in accidents.

Introduction of product :-

A helmet is a form of protective gear worn to protect the head.

More specifically, a helmet complements the skull in protecting the human brain originally a helmet was a helm which covered the head only partly and protected it from injury in accidents.

In civilian life, helmets are used for recreational activities and sports

e.g:- jockeys in horse racing, American football, ice hockey, cricket, baseball, camogie, hurling and rock climbing.

dangerous work activities

e.g:- construction, mining, riot police.

transportation

e.g:- motorcycle helmets and bicycle helmets. Since the 1990s, most helmets are made from resin or plastic, which may be reinforced with fibers such as aramids.

Partner's details :-

1. Shreeraksha :-

Name :- Shreeraksha

Age :- 20 Years

Marketing potential :-

India Bike helmet market,
By type (MTB Helmet, Road Helmet and
Sports Helmet), By Distribution channel
showrooms, supermarket /Hyper market,

- Brand Stores, Online and Others),

Competition forecast and Opportunities,

14 - 2024.

India bike Helmet market is

expected to grow during 2020-2024.

Innovation such as carbon fibre helmet,

cooled technology in helmets, helmets

with anti-glow visor, push button and

helmet lock features, increasing number

of helmet manufacturers and safety rules.

Moreover, increasing disposable income,

increasing disposable income, increasing

disposable population and growth auto

mobile sector - are some of the other

factors expected to propel demand for

bike helmet over the next five years.

Years considered for this report:

Historical Year : 2014 - 2017

Base Year : 2018

Year : 2019

Estimated

Forecast period : 2020 - 2024

Subject:- Computer Fundamental.

Lack of Decision-making.

Decision-making is a complicated process involving information, knowledge, intelligence, wisdom, and ability to judge. The computer systems do not have the ability to make decisions on their own because they do not possess all the essential elements of decision-making.

Computers can't Decide:-

Computers are incapable of decision-making as they do not possess the essential elements necessary to take a decision. That is knowledge, information, wisdom, intelligence and the ability to judge.

Assignment

Limitations of computers.

Lack of common-sense:-

This is one of the major limitations of computer systems. No matter how efficient fast and reliable computer systems might be but yet do not have any common sense because no full-proof algorithm has been designed to programme logic into them. As computers function based on the stored programme(s) they simply lack common sense.

Zero IQ :-

Another of the limitations of computer systems is that they have zero Intelligence Quotient (IQ). They are unable to see and think the actions to perform in a particular situation unless that situation is already programmed into them. Computers are programmable to complete each and every task, however small it may be.

Computer can't Express: their Ideas In any type of Research Ideas play a vital role. In this context, Computer can't express their ideas.

Computers can't Implement: Though computers are helpful in storage of data and can contain the contents of encyclopedias Even, but only humans can decide and implement the policies.

4. Education:—The application of computer play vital role in computer aided learning and teaching is changing the entire structure of our education system. The multi media rich computerized animation and video help students to understand the concepts in a very simple and effective manner.

5. media and communication:—The application of computer has played a major role in revolutionizing the communications system. From advent of telephone and television which were perceived as incredible things we have come a long way to enjoy the facilities like mobile phones, the internet, E-mail, SMS, chatting, cable TV, video conferencing etc.

6. Criminal identification and law enforcement:—The application of computers can make close resemblance Photographs of criminals. This help CBI (Central Bureau of Investigation) Staff to identify the criminals. The police use the DNA finger printing technique to identify accused with the help of skin, hair, or blood samples collected from the site of crime.

The application of computer in various fields.

1. Military:- The application of computer plays a vital role in the design and development of high tech weapons for defense where absolute accuracy is essential. The whole world saw the vast use of computers in defense during the gulf and Afghanistan wars and also in the Iraq war.
2. Banks:- As a result of the computerization and networking of a large number of banks, several facilities are being offered to the customers. Using online banking, you can check your past transactions from the date of the account opening with real time balance.
3. Research:- The computer is facilitating the research work in a tremendous way by performing complex computations which sometimes seems impossible for humans. Some of them are listed below.
4. Entertainment:- At home, the application of computer is being used for as well as entertainment with the advent of a computer, the member of the family can have easy access to games music, mail e-mail, chatting, and researching for their projects and assignments. People can even enjoy the facility of watching television on their computers.
5. Business:- Computer has helped in improving business activities throughout the world. The organization can have access to the latest technology and manpower across the world. E-commerce has completely changed the scenario of online shopping.
6. Book Publishing:- With the help of the application of computers, designing, typing, and editing work can be done with great ease and efficiency. We can insert pictures apply various formatting features and styles to a book in no time using a computer.

10. Commercial purpose:- Advanced reservation or room in hotels and booking of cinema ticket is now possible from anywhere with the advent of the Internet. The Billing system in theaters, shopping malls are hotels that have become possible through computer.

Input devices

- * Keyboard
- * Joy stick
- * Light pen
- * Track ball
- * Scanner
- * Graphic Tablet
- * Microphone
- * Magnetic ink card reader (MICR)
- * Optical character reader (OCR)
- * Bar code Reader
- * Optical mark reader (OMR)

Output devices :-

- * Monitor
- * Webcam
- * Speaker
- * Microphone
- * Pointer
- * Headphone
- * Plotter
- * CD / DVD
- * USB

Pattabhiram

Secondary Storage Example :-

Technologies include

- * USB flash drives
- * Floppy disks
- * Magnetic tape
- * Paper tape
- * Punched cards
- * Ram disks.

1. What is variable declaration with an example.
- All variables must be declared before they are used in a C program. The purpose of declaring variables is to reserve the amount of memory required for these variables. The declaration is made in the declaration part of a C program.

Syntax:- Data type Variable List Semicolon

Ex :- int length;
 float area;

- 2} List the rules for naming an identifier.

- First character must be an alphabet.
- Must consist of only letters, digits, or underscores.
- Only first 31 characters are significant.
- Cannot use a keyword.
- Must not contain whitespace.

3. Convert it $11101_{(2)} = 29_{(10)}$

2^4	2^3	2^2	2^1	2^0
1	1	1	0	1

$$11101_{(2)} = 16 + 8 + 4 + 0 + 1 = 29_{(10)}$$

ii} $94.825_{(10)}$

$$94.825_{(10)} = 101110.1101_{(2)}$$

$$\begin{array}{l}
 \begin{array}{r}
 94 \\
 47 - 0 \\
 23 - 1 \\
 11 - 1 \\
 5 - 1 \\
 9 - 1 \\
 \hline
 1 - 0
 \end{array}
 \begin{array}{r}

 0.6 \times 2 = 1.2 \\
 \end{array}
 \begin{array}{r}
 1 \\
 1 \\
 0 \\
 1 \\
 \end{array}
 \\[10pt]
 = 101110.1101_{(2)}
 \end{array}$$

4. Differentiate Hardware and Software.

Hardware	Software.
<ul style="list-style-type: none"> These are physical components of a computer system. Users can see touch and feel the hardware. Hardware works based on the instructions of the software. Hardware components are less expensive. 	<ul style="list-style-type: none"> These are the logical components of a computer system. Users cannot touch the software. Software tell the hardware what to do. Software are generally costlier as compared to hardware.

5. Explain general form of scanf().

→ Syntax: `scanf ("control string", address),`

or Define a) compiler b) loader

a) compiler

→ It is a program which translates a high level language program into a machine level language program.

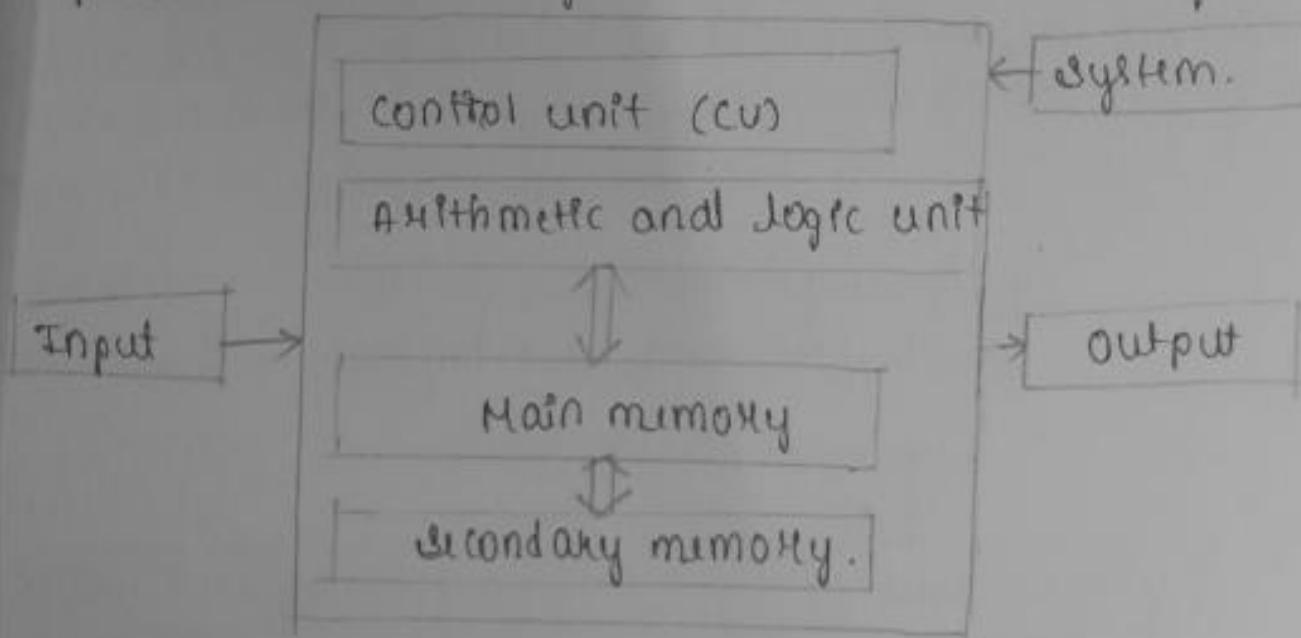

• It is slow speed because a compiler goes through the

entire program and then translates the entire program into machine code.

Q) Loader :- Loader is a program that loads machine code of a program into the system memory.

Q) What is a computer? With neat block diagram, explain the functional units of a computer system.

→ Computer is an electronic device which receives the input & processes the data and gives the result in desired format

Input :- Accept the data and instruction from the outside world. convert it to a form that computer understand. Supply the converted data to the computer system for further processing.

Storage unit :- The storage unit of the computer holds data and instructions that are entered through the input unit. There are two types of storage

① Primary storage

② Secondary storage.

System unit :- Fetching data & instruction from the memory. Interpreting the instruction. Controlling the transfer of data.

and instruction to and from the main memory. The overall
supervision of a computer system.

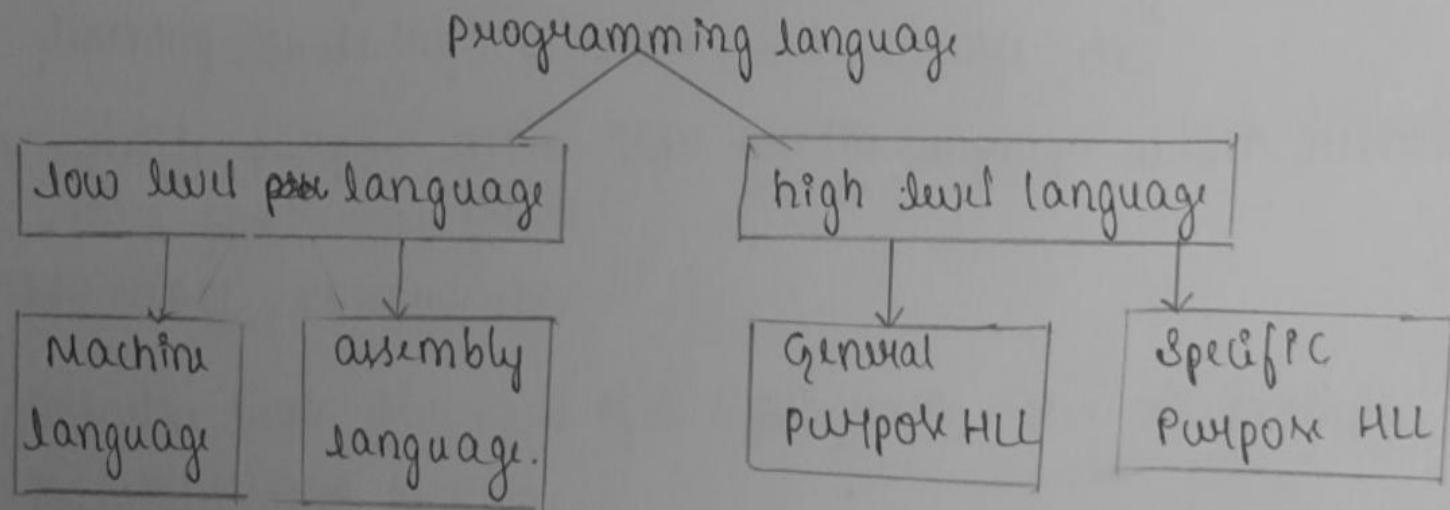

Memory devices :- memory device used to store the data and
instructions fed by the user. The computer memory is classified
into :-

- CPU register.
- main memory.
- secondary memory.
- cache memory.

Output devices :- once the data & instructions are processed, the
user can choose to display such results on the output device.
Ex :- printer, plotter, speaker, and etc.

Q. Explain the types of programming language!

→ They are classified into two categories.

Programming language is a set of rules called syntax
which the user has to follow, to instruct the computer
what operation has to be performed.

Low level language - The low level languages are easily un-
derstood by computers. They are machine dependent languages.

Low level language is of two types :-

- ① Machine level language
- ② Assembly level language

- 1. Machine level language is nothing but the set of instruction given to the computer in the form of 0's and 1's.
- 2. These are the programming language which use the symbolic instruction. Symbolic oriented programming language is known as assembly language or symbolic language.
- * High level language - Programming languages that are more concerned with the problem specification and not oriented towards the details of a computer are called the high-level language.

It is classified into two types

- i) General purpose HLL - They are used in the fields such as teaching, training, business, art, science etc
- ii) Specific purpose HLL - They are the languages which are restricted to a particular field.
ex: COBOL, PROLOG etc

- 9. Describe basic structure of a C program. Give an example.

→ Documentation section:
Link section
Definition section
Global declaration section
Main function
Subprogram section.

- 10 Documentation section - It is the part of the program where the programmer give the details associated with the program

He usually give the name of program, the details of the author and other details like the time of coding and description. It gives anyone reading the code the overview of the code.

Ex:- /* Documentation section;

- Program name : Program to find the area of circle
- Author : Varun
- Date : 10/01/2020
- Time : 10 AM.

*/

• Link section :- The link section consists of the header files of the functions that are used in the program. It provides instructions to the compiler to link function from the system library. This part of the code is used to declare all the header files that will be used in the program. This leads to compiler being told to link the header file to the system library.

Ex:- # include <stdio.h> // Link section.

include <conio.h> // Link section.

Definition section :- All the symbolic constants are written in definition section. Macros are known as symbolic constants

Ex:- # define PI 3.14 // definition section.

Global declaration section :- The global variables that can be used anywhere in the program are declared in global declaration section.

Ex:- float area; // global declaration section.

• Main function section :- The main function section in every C program. This section contains two parts - declaration & executable part. The declaration part declares all the variables that are used in executable part. These two parts must be.

DVS College of Arts and
Science.

Shivamogga.

Name:- Hauththa. S

course:- BCA

Sem:- 1st Sem

Subject:- IIT

Part - A.

1.a. Define Software ?

Software is the set of programs, procedure - ex. algorithms, and documents concerned with the operation of data processing system.

b. Define Assembler.

Assembler is the translator for assembly language. Assembler is the system software which translates programs written in assembly language into machine language.

c. Define linker.

A source program written in high-level language may contain a number of modules or segments. For the program to be executed properly the modules are to be linked properly and the various library segment include so the execution of program is sequential. This operation is performed by software called as the linker. The linker is system software which links the modules or program segment together so that they can be executed properly with proper reference.

d. Define System software.

System software collection of system programs to perform common tasks of a system. Software is a program or a sys group of program written for computer system software.

Define Interpreter?

Interpreter is a language processor that translates an instruction of a high-level language program and immediately executes it before translating the next instruction of the source programme.

Explain the types of Software with an example.

The types of Software are:-

1. Application Software.
2. System Software.

Application Software is a program or collection of programs written by the user to solve a particular problem.

Application Software or simply application, are often called productivity programs or end-user programs because they enable the user to complete tasks. Application Software generally written in high level languages. Application Software's are hardware independent and these are portable.

Example: MS-office, Tally, Sybase, etc.

System Software:-

System Software is a collection of system programs to perform common tasks. Or a system is a program or a group of programs written for computer system management.

The objective of System Software is to efficiently perform the function commonly required by most of the users. In order to achieve this objective their programs are generally written at the machine level using instructions of for addressing various registers of the CPU. Thus System Software is hardware dependent and not portable. Input / output operating are generally performed by System Software. Programming languages like assembly like C/C++ / Pascal are used to develop System Software.

C). write a note on
i) Loader ii) Compiler.

i) Loader:- Once an executable program is generated someone will have to loader into the main memory of the computer so that it can be executed. This operation is performed by System Software called Loader. It actually places the object code from secondary memory storage into main memory and starts execution. The loader is System Software which accepts the object program produced by the compiler or assembler and prepares them programs of execution.

ii) Compiler:-

Compiler is System Software that translates source code written in high level language into object code with which is in machine language. A compiler will check the entire source code for Syntax & Semantics every line by line & produces executable file only if it is free from all errors.

a) Explain the Classification of Programming languages.

language is a medium of communication. If we have to communicate with the computer, we require a suitable language understandable by the computer. Such a language is called programming languages.

Programming languages:- It is a set of rule called Syntax which the user has to follow, to instruct the computer what operations are to be performed.

* machine level language:-

Machine level language is nothing but the set of instructions given to the computer in the form of 0's and 1's. So machine level language consists of only 0's and 1's. This

is the language of computer. A 0 indicates low voltage level and 1 indicates high voltage level. The machine level language is considered as the first generation language. This is because the programming was started with this language.

Any sequence of 0's and 1's forms an instruction in the machine language. For example:-

1010101011

1110001000 etc.

* Assembly level language:- To overcome the drawbacks of the machine level language i.e., using of 0's & 1's to represent an instruction, computer engineers developed a new programming language which uses the symbolic instructions. This symbolic

instruction oriented programming language is known as assembly language or the assembly level language or symbolic language. The assembly language is considered as the second generation programming language.

for example:-

ADD for Addition.

SUB for Subtraction.

MUL for multiplication. etc

* High level language:-

The machine language and assembly language are highly machine dependent. It will be very difficult for the programmer to switch over from one machine language to another and from one assembly language which are more closely related to the problems than the machine programming language that are more concerned with problem specification and not oriented towards the details of a computer are called the high level language (HLL).

High level languages are English like languages. The elements of these languages are alphabets, digits, punctuation and other special symbols. The instruction composed of these elements, hence, each and every instruction is easier to read, write and understand. Instruction in the high-level languages are machine independent. These are standardized as compared to the other two programming languages such as machine language and assembly language.

The Compiler & interpreter are two translators programs which are used to translate the high level language program into the machine language.

For example:- consider the high level language C program to add two numbers.

```
void main()
{
```

```
    int a=10, b=20, sum; // value of a=10, b=20
```

```
    sum=a+b           // Add value of a, b and store  
                      in sum
```

```
    printf("sum=%d", sum); // print the result on  
                           the screen
```

```
}
```

list advantage & disadvantages of object oriented languages. ~~disadvantages~~

Advantage

- * Since everything is treated as objects, so we can model a real-world concept using oop.
- * Through inheritance, we can eliminate redundant code and extend the use of existing class.
- * It is possible to have multiple instances of an object to co-exist without programs any interference.
- * It is possible to map objects in the project based on objects problem domain to those in the program.
- * It is easy to partition the work in a project based on object.
- * Software complexity can be easily managed.

- Disadvantages:-
- * Designing a program in oop concept is a little bit tricky.
 - * The programmers should have a proper planning before designing a proper skill such as a program using oop approach.
 - * Since everything is treated as objects in oop, the program must need proper skill such as design skill, programming skills, thinking in terms of objects etc.
 - * The size of programs developed with oop is larger than the procedural approach.
 - * Since larger in size, that means more instructions to be executed, which results in the slower execution of programs.

Write a note on Event driven programming languages.

Event Driven: An event-driven application is a computer program that is written to respond to actions generated by the user or the system. In a computing context, an event is any identifiable occurrence that has significance for systems hardware or software. By such, events include both user-generated actions like mouse clicks and keystrokes and system-generated events such as program loading.

In computer programming, event-driven programming is a programming paradigm in which the flow of the program is determined by event such as user actions (mouse click, key presses), sensor outputs or messages from other programs or threads. Event-driven programming is the dominant paradigm used in graphical user interfaces and other applications (ex. JavaScript web applications) that are centered on performing certain actions in response to user input. This is also true for the programming of device drivers (Ex. Pin USB device driver stacks).

① Comparisons b/w conductors, semiconductors and insulators

Property	Conductors	Semiconductors	Insulators
1. Electrical conductivity	Very high (10^{-7} mho/m)	B/w those of conductors & insulators e.g. 10^{-7} mho/m to 10^{-13} mho/m	Negligible [10^{-13} mho/m]
2. Resistivity	Negligible i.e. less than $10^5 \Omega\text{m}$	B/w those of conductors & insulators e.g. $10^{-5} \Omega\text{m}$ to $10^5 \Omega\text{m}$	Very high more than $10^5 \Omega\text{m}$
3. Energy gap	zero or very small	more than in conductors but less than insulators e.g.: $\Delta E_g = 1.3\text{ eV}$	very large e.g.: diamond $\Delta E_g = 7\text{ eV}$
4. Current carriers and current flow	Due to free electrons and very high	Due to free e^- & holes. more than in insulators	Due to free e^- but negligible
5. Number of current carriers [electrons or holes] at ordinary temp.	very high	very low	negligible
6. Condition of valence and conduction band at ordinary temp.	Both are completely filled or conduction band is somewhat empty Eg: Na	Valence band is somewhat empty & conduction band is filled	Valence band is completely filled & conduction band is completely empty.
7. Behaviour at 0K	Behaves like a superconductor	Behaves like an insulator	Insulates only.

Property	Conductors	Semiconductors	Insulators
Temp. co-eff cient of resistance (α)	Positive ✓	Negative ✓	Negative.
Effects of temp. on conductivity	conductivity decreases ✓	increases ✓	increases ✓
On increa- sing temp. No. of curre- nt carriers	Decreases ✓	Increases ✓	Increases ✓
On mixing impurities their resista- nce	Increases ✓	Decreases ✓	Remains unchanged
Current flow in the case takes place	Easily & very fast	Very slow ✓	Doesn't takes place
Examples	Cu, Ag, Na Pt, Hg etc	Ge, Si, Ga, As	Wood, Plastic mica, diamond glass etc.

Comparison between intrinsic and extrinsic semiconductors

Intrinsic semiconductors	Extrinsic semiconductors
1. Pure semiconductors are known as intrinsic semiconductors	The semiconductor resulting from mixing impurity in it is known as extrinsic semiconductors
2. Their conductivity is low	Conductivity is high
3. No. of free electrons & no. in conduction band is equal to the number of holes p in valence band	In there no. of p_i
4. These are not practically used	These are practically used
5. Energy gap is very small	More than in pure semiconductors
6. The fermi energy level lies in the middle of valence & conduction band	The fermi level shifts towards valence or conduction energy bands
7. Eg:- Si & Ge	Eg:- P , Sb , Ga , In etc. dopants.

Comparison between N-type and P-type semiconductors

N-type semiconductors	P-type semiconductors
In these the impurity of some pentavalent element like P, As, Sb, Bi etc are mixed.	In these the impurity of some trivalent element like B, Al, In, Ga etc are mixed.
2. In these the impurity atom donates one electron, hence these are known as donor type semiconductors.	In these impurity atom can accept one electron, hence known as acceptor type semiconductors.
3. The electrons are majority charge carriers & holes are minority charge carriers i.e. electronic density is more than hole density. $n_n \gg n_p$	Holes are majority charge carriers & electrons are minority charge carriers i.e. $n_p \gg n_n$
4. There are majority of -ve particles (e^-) & hence are known as n-type semiconductors.	There are majority of +ve particles (holes) & hence are known as p-type semiconductors.
5. In these donor energy level is close to the conduction band and far away from valence band.	In these the acceptor energy level is close to the valence band & far away from conduction band.

Comparison between pn-junction diode and zener diode

pn-junction diode	zener diode.
can conduct current only in one direction	zener diode allows the conduction in both directions
will be permanently damaged for a large reverse current	will not be permanently damaged for a large reverse current.
Normally used for rectification	Used for voltage regulation
A pn-junction diode is made of a crystal of semiconductors	It allows electrons to tunnel from the valance band of p-type material to the conduction band of n-type.

electronics

1. Comparison between Conductor, Insulator and Semiconductor.

Conductor	Insulator	Semi Conductor
<ul style="list-style-type: none"> * Large amount of electrons are available for conduction. * Conduction band and Valence band overlap each other. 	<ul style="list-style-type: none"> * No free electrons are available for conduction. * Conduction and Valence band are separated by a large energy gap called forbidden energy gap. 	<ul style="list-style-type: none"> * Conductivity of semiconductor lies between conductors and insulators. * Conduction and Valence band are separated by a small energy gap. 

2. Distinguish between Intrinsic and Extrinsic Semiconductor

Intrinsic Semiconductor	Extrinsic Semiconductor
<ul style="list-style-type: none"> * Doping of impurity does not takes place in intrinsic semiconductor. * The number of free electrons in the conduction band is equal to the number of holes in the valence band. * Electrical conductivity is low. * Electrical conductivity is a function of temperature alone. * Eg:- Silicon, Germanium 	<ul style="list-style-type: none"> * A small amount of impurity is doping pure semiconductor. * The number of electrons and holes are not equal. * Electrical Conductivity is high. * Electrical conductivity depends on temperature as well as amount of impurity doping in the pure semiconductor. * Eg:- Si, P, In, Bi etc.

3. Difference between n-type and P-type Semiconductors

n-type Semiconductor	P-type Semiconductor
<ul style="list-style-type: none"> * They are obtained by adding pentavalent impurity atom. * Electrons are majority charge carriers. * Holes are minority charge carriers. * Impurity atoms ^{are called} donor atoms. * Eg:- Boron, Aluminium 	<ul style="list-style-type: none"> * They are obtained by adding trivalent impurity atom. * Holes are majority charge carriers. * Electrons are minority charge carriers. * Impurity atoms ^{are called} acceptors. * Eg:- Arsenic

1. Compare Junction diode and Zener diode.

Symbol	P-N junction diode	Zener diode
Definition	* It's a semiconductor diode which conducts only in one direction i.e. in forward direction.	* The diode which allows the current to flow in both forward and reverse direction.
Symbol		
Reverse Current effect	* Damage the junction	* Don't damage the junction.
Breaking Level	* Low	* High
Breakdown	Occurs in higher voltage.	Occurs in lower voltage.
Don't obey's application	* For rectification	* Don't obey. * Voltage stabilizer, wave shaping

5. Write a note on:-

a) Diffusion Current:

Diffusion current is a current in a semiconductor caused by the diffusion of charge carriers. This is the current which is due to the transport of charges occurring because of non-uniform concentration of charged particles in a semiconductor. Diffusion current can be in same or opposite direction of a drift current.

It is necessary to consider the part of diffusion current when describing many semiconductor devices. For example, the current near the

depletion region of p-n junction is dominated by the diffusion current and drift current are present. At equilibrium in a p-n junction the forward diffusion current in depletion region is balanced with a reverse drift current so that the net is zero.

The diffusion constant for a doped material can be determined with the Haynes-Shockley experiment. Alternatively, if the carrier mobility is known the diffusion Co-efficient may be determined from the Einstein relation on electrical mobility. The diffusion current obeys Ohm's law. $J = q \mu E$.

b:- Drift Current :-

In condensed matter physics and electrodynamics drift current is the electric current or movement of charge carriers which is due to the applied electric field, often stated as the electromotive force over a given distance. When an electric field is applied across a semiconductor material, a current is produced due to flow of charge carriers.

The drift velocity and resulting current is characterized by the mobility. The drift is most commonly used in the context of electrons and holes in semiconductor, although the same concept also applies to material (metals, electrolytes and so on).

The amount of drift current depends on the concentration of charge carriers and their mobility in a material and medium. The drift law obeys Fick's law $J = -qD \frac{dp}{dx}$

b) Fermi level

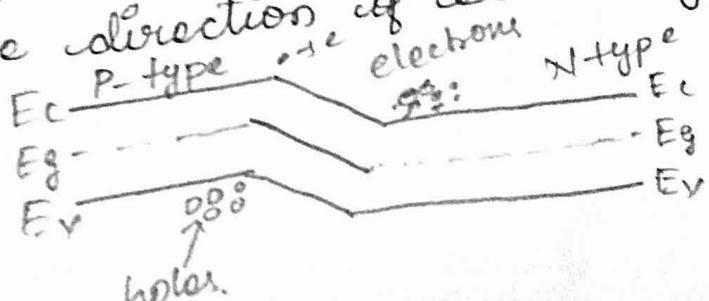

Fermi level is the highest energy state occupied by electrons in a material at absolute zero temperature. As the temperature is increased, electrons start to exist in higher energy state too.

In a p-type d.c. there is no increase in the density of unfilled states. Thus more electrons can be accommodated at lower energy states. In a n-type semiconductor, the DOS is increased. Thus, electrons have to be accommodated at higher energy levels.

Fermi level is also defined as the work done to add an electron to the system. More positive (more holes) in a p-type semiconductor mean lesser work needs to be done. Hence it has lower fermi level.

c) What is tunneling effect and also explained it.

In electronics tunneling is known as direct flow of electrons across the small depletion region from n-side conduction band into the p-type side valence band. In a p-n junction diode both positive and negative ions forms the depletion region. Due to these ions, inbuilt electric potential or electric field is present in the depletion region. This electric field is present in the depletion region. This electric gives an electric force to the opposite direction of externally applied voltage.

Ec = Conduction Band
Eg = Energy Gap
Ev = Valence Band

As the width of the depletion layer reduces, charge carriers can easily cross the junction. Charge carriers do not need any form of kinetic energy to move across the junction. Instead, carriers push through junction. This effect is called tunneling effect and hence the diode is called tunneling diode.

Due to tunneling, when the value of forward voltage is low value of forward current generated will be high. It can operate in forward biased as well as in reverse biased. Due to high slopping it can operate in reverse biased. Due to reduction in barrier potential, the value of reverse breakdown voltage also reduces. It reaches a value of zero. Due to this small reverse voltage leads to diode breakdown. Hence this creates negative resistance regions.

6. List out n-type (Donor) & P-type (Acceptor) impurities.

n-type:- Pentavalent impurity such as Arsenic, Antimony, Bismuth, phosphorous,

P-type:- Divalent impurity such as Boron, Indium, Aluminum,

④ Explain the construction and working of S-R Flip-Flop

A S-R FlipFlop may be constructed in many ways. The above figure shows one way of constructing SR flip flop using four ~~NAND~~ NAND gates. These are two simple I/p NAND gates and two o/p NAND gates. The feedback mechanism shown clearly in the figure.

There are two inputs called set i/p and Reset i/p. Applying triggering i/p to "S", sets the Flip Flop and applying triggering i/p to "R", Resets the flip flop.

circuit operation :-

Case ① :- When $S=R=0$
In this case it can be seen that the o/p $Q \& \bar{Q}$ will remain in ~~this~~ case their original state i.e no change in the o/p state.

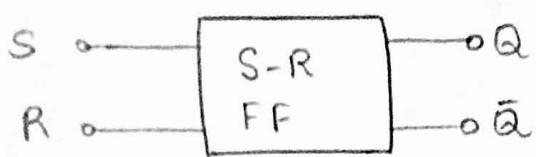

Case ② :- When $S=1 \& R=0$
In this case the o/p of G_1 is 0 \therefore irrespective of \bar{Q} . The o/p G_3 is 1 i.e $Q=1 \therefore$ The FF sets to 1.

Case ③ :- When $S=0 \& R=1$
In this case it can be seen that the o/p Q changes to 0 i.e the FF resets to 0.

Case ④ :- When $S=R=1$
In this case contradiction results because the

FF simultaneously tries to set & reset which is not possible \therefore This condition is forbidden (2) invalid.

Logic symbol :-

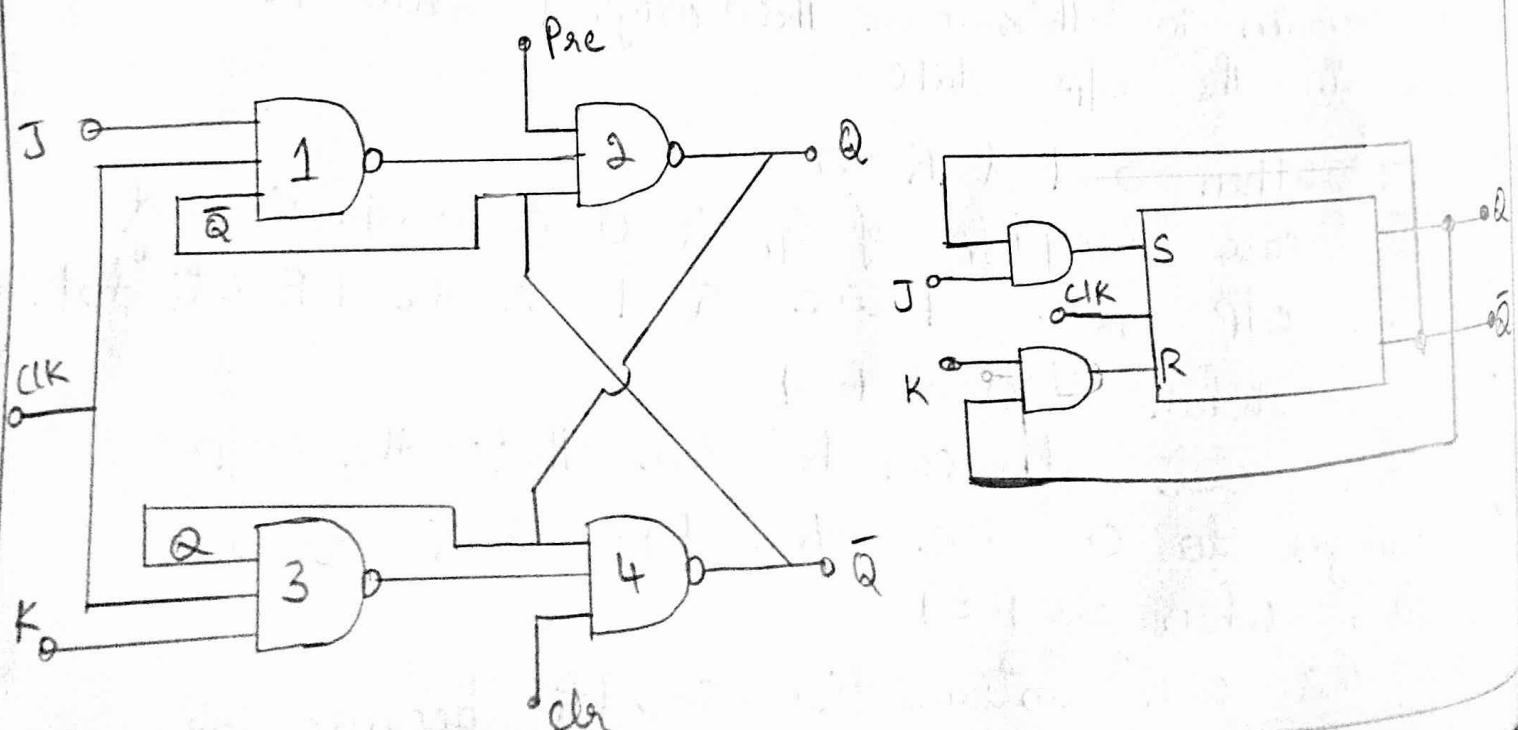

Truth table :-

input		output	
S	R	Q	\bar{Q}
0	0	No change	maintains previous state
1	0	1	0 (sets)
0	1	0	1 (Resets)
1	1	Invalid	or forbidden

It may be noted that a flip flop has 2 outputs i.e. Q & \bar{Q} i.e. when $Q=1$, $\bar{Q}=0$ & vice versa \therefore Flip Flop is a natural circuit for producing a variable & its complement.

⑤ Explain the construction and working of J-K Flip Flop.

\Rightarrow In S-R FF the condition $S=R=1$ is forbidden because it leads to a contradiction this uncertainty is avoided in another type of FF called J-K Flip Flop.

It can be constructed in many ways using a ~~clocked~~
 clocked SR FF and two AND gates, it can be constructed
 as shown in fig (a). We need to use AND gates
 but by adding extra terminals to gate G_1 & G_3 where
 \bar{Q} is feedback to G_1 & Q is feedback to G_3 .
 J-K FlipFlop is shown in fig.

Circuit operation :-

i) clk = 0 [i.e low] :- In this case the two gates G_1 & G_3
 are disabled or inhibited because their O/P's are
 equal to 1 irrespective of the values of J & K.
 \therefore There will be no change in the state of the O/P.

ii) When clk = 1 [i.e high] :-

case @ :- When $J=K=0$, In this case there will be
 no change in the state of O/P.

case (b) :- when $J=1$, $K=0$

Here again two cases arises.

i) If initially $Q=0$ & $\bar{Q}=1$
 In this case the 3 inputs to the gate G_1 are $J=1$,
 $clk=1$, $\bar{Q}=1$
 \therefore output of G_1 is $Q=1$ & hence the O/P of G_{12} changes
 to 1 i.e $Q=1$ [$\bar{Q}=0$]

ii) If initially $Q=1$ & $\bar{Q}=0$
 In this case 3 inputs to the gate G_1 are $J=1$,
 $clk=1$, $\bar{Q}=0$

\therefore The output of G_1 is 1 & hence the output of G_{12}
 remains at 1 i.e $Q=1$

\therefore when $J=1$ & $K=0$ Q changes to 1 if it is
 initially at 0 & Q maintained at 1 if it is at 1

③ When $J=0, K=1$

In this case similar to above if Q is initially at 1. it will change to 0 [reset], and if it is initially at 0 it remains at 0.

④ When $J=1, K=1$ [again two case arises]

i) Initially $Q=0 \text{ & } \bar{Q}=1$

Now the three inputs to the gate G_1 is 1 \therefore its o/p is 0. Hence the output of G_2 i.e Q becomes 1

ii) Initially $Q=1 \text{ & } \bar{Q}=0$

Now the three inputs to the gate G_3 are 1

\therefore output is 0. \therefore The output of G_4 is 1 i.e $\bar{Q}=1$

Hence $Q=0$. Thus when both i/p's are equal to 1.

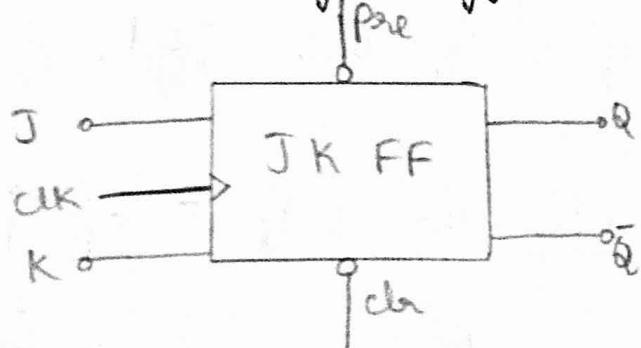

Q changes to 1 if it is initially at 0 & it changes to 1 if it is initially at 1. This is called Toggling.

Truth table :-

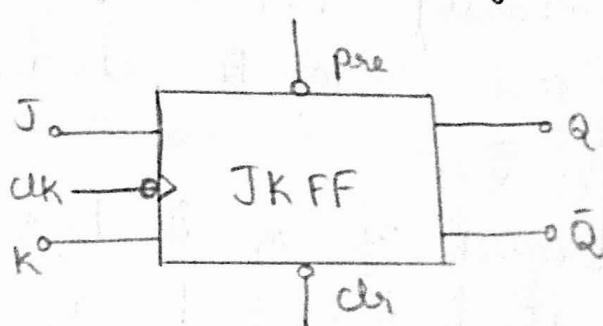

I/P			O/P	
Clk	J	K	Q	\bar{Q}
0	x	x	No change	
1	0	0	No change	
1	1	0	1 0 [set]	
1	0	1	0 1 [reset]	
1	1	1	Toggle	

Logic symbol :-

+ve edge triggered

-ve edge triggered

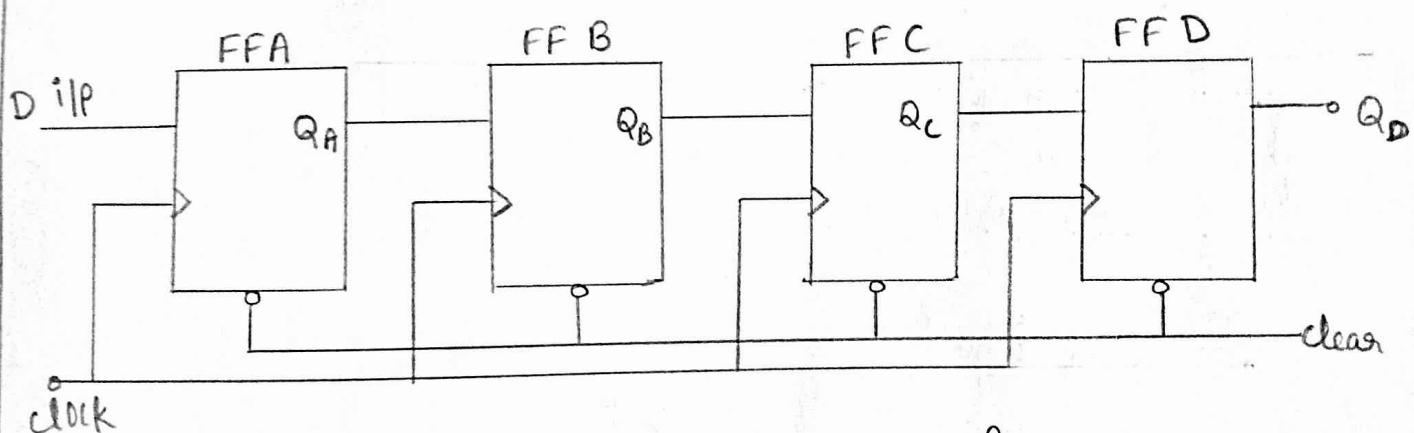

- 6) a) What are registers? And Mention different types
 b) Explain the working of SISO shift registers.

⇒ a) A group of cascaded Flip-Flop's used to store binary information is known as registers.

- Types:-
- ① Serial in serial out (SISO)
 - ② Serial in parallel out (SIPO)
 - ③ Parallel in parallel out (PIPO)
 - ④ Parallel in serial out (PISO).

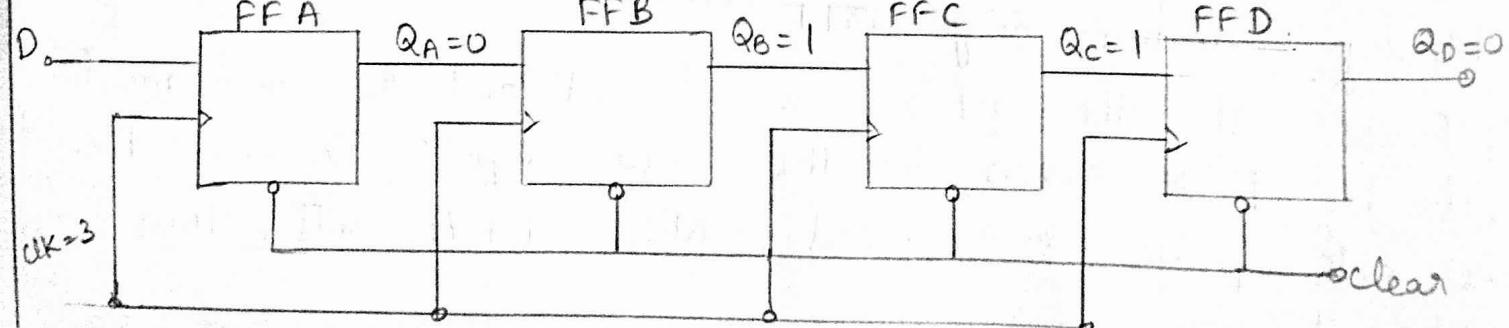

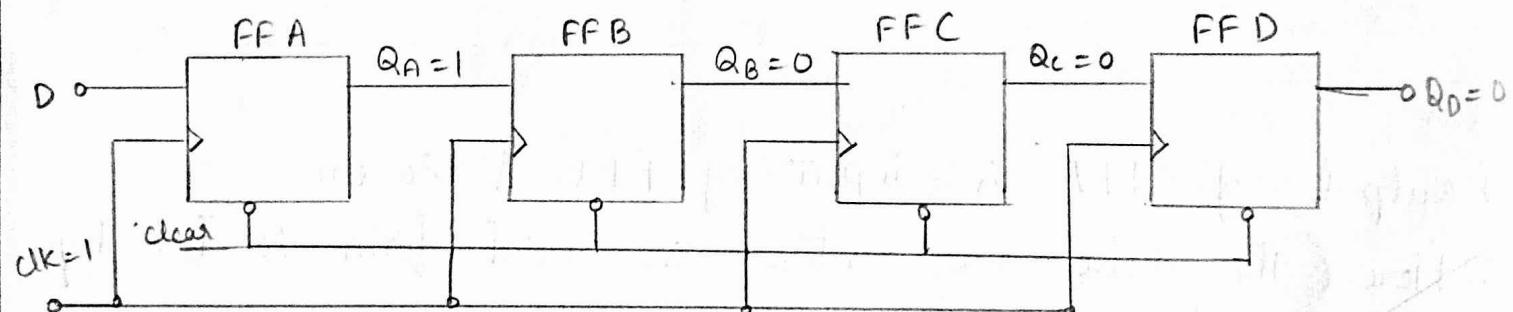

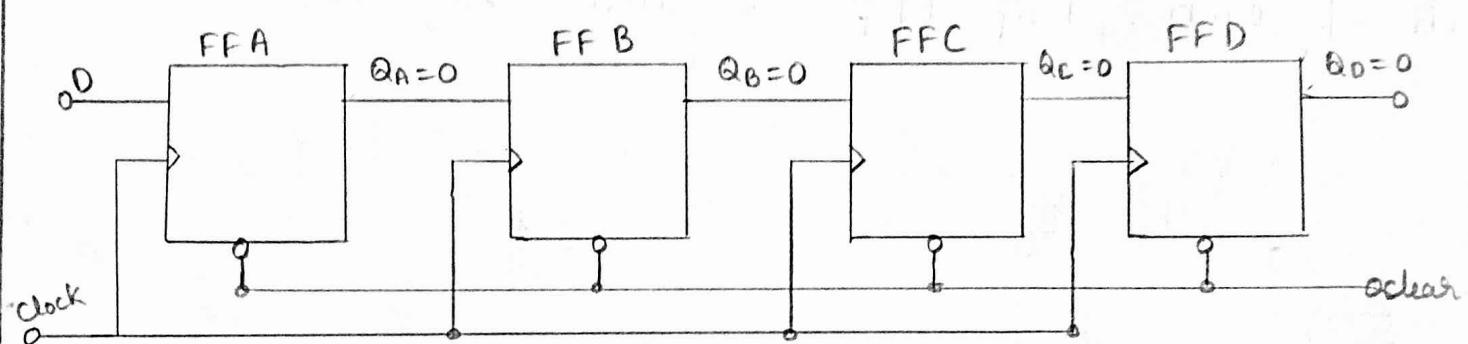

b) SISO Shift register

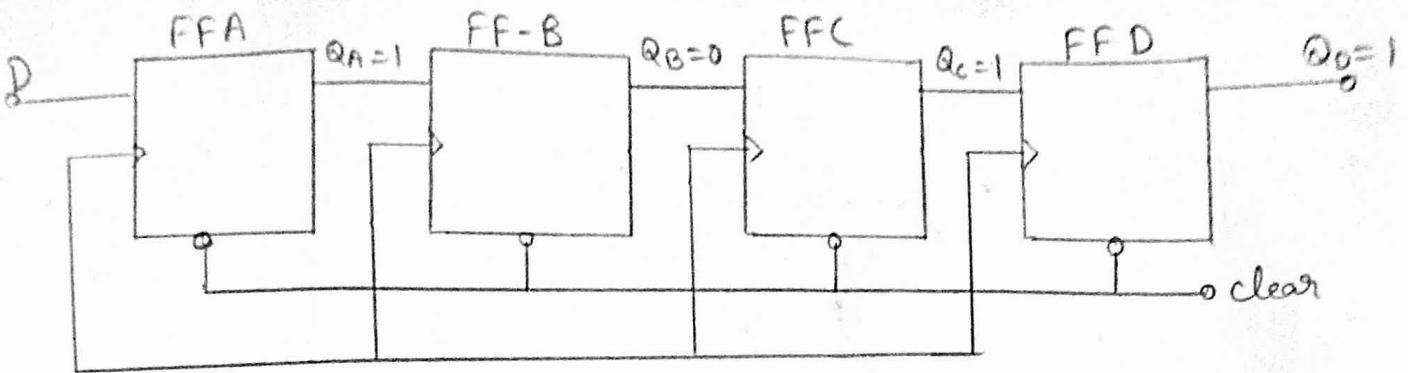

A 4bit SISO shift register using Delay Flip Flop is as shown, there are four Flip-Flop's and a clock of each Flip-Flop are tied together.

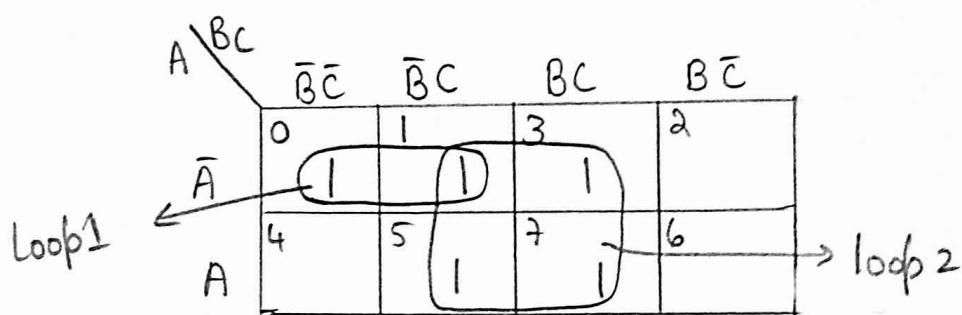

- * output of FFA is input of FFB & so on
- * Here the data are entered in serial form i.e bit by bit basis.
- * Let us take an ex for illustrating serial entry of binary number say 1011
 - i) First all the FF's are cleared and the right most bit i.e 1 is given to the data input D and then the clk pulse is applied, Now FFA sets, thus stores 1.

- ii) Now the 2nd data bit 1 is applied to the data i/p making D=1 for FFA & D=1 for FF=B and a clock 2 i.e 2nd clock pulse is applied -thus the data in FFA is shifted to FF B.
- iii) Now the 3rd bit '0' is given to the D i/p of FFA & a 3rd clock pulse is applied, Now 0 is stored in FFA and 1 is shifted to FF B.
- iv) Finally the last bit 1 is given to the D i/p of FFA and 4th clock pulse is applied, Now 1 is stored in FFA and 0 in FFA is shifted to FF B, 1 in FFB is shifted to FFC & 1 in FFC is shifted to FFD
- This completes the serial entry of the 4-bit number into the shift register where it can be stored for any length of time the below figure illustrate each step in the shifting of 4 bit into register.

③ Simplify using K-map $f(ABC) = \sum m(0, 1, 3, 5, 7)$
 and realise final expression using basic gates.
 $\Rightarrow 2^n = 2^3 = 8$ cells (0 to 7)

loop 1 :- $\bar{B}\bar{C}$, $\bar{B}C$, \bar{A}
 $C\bar{C}$ is eliminated

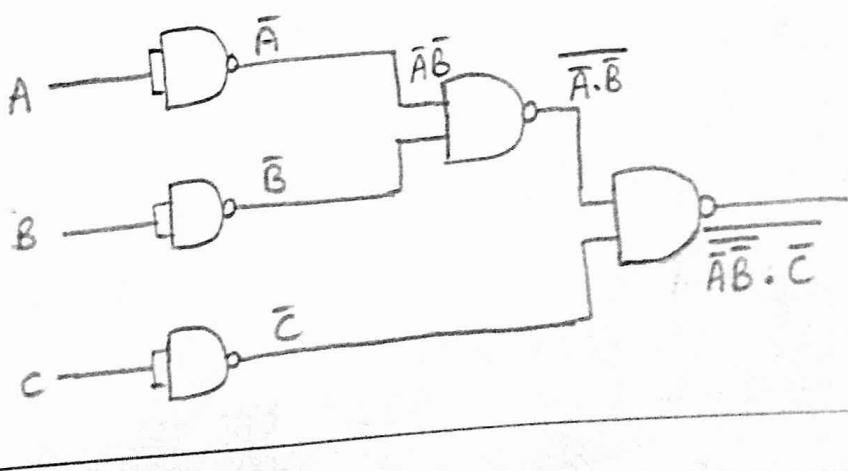

loop 1 expression = $\bar{A}\bar{B}$

loop 2 :- $(\bar{A}A)(\bar{B}C)(BC)$
 $B\bar{B}$ & $A\bar{A}$ is eliminated

loop 2 expression = C

final simplified expression is.
 $f(ABC) = \bar{A}\bar{B} + C$

$$\begin{aligned}y &= \bar{A}\bar{B} + C \\ \bar{y} &= \overline{\bar{A}\bar{B} + C} \\ \bar{y} &= \overline{\bar{A}\bar{B}} \cdot \bar{C} \\ \bar{\bar{y}} &= \overline{\overline{\bar{A}\bar{B}} \cdot \bar{C}}\end{aligned}$$

REFUGEE BLUES

- By W.H. AUDEN

Say this city has ten million souls,
Some are living in mansions, some are living in holes:
Yet there's no place for us, my dear, yet there's no
place for us

Once we had a country and we thought it fair;
Look in the atlas and you'll find it there:
We cannot go there now, my dear, we cannot go there now.

In the village churchyard there grows an old yew,
Every spring it blossoms anew:
Old passports can't do that, my dear, old passports can't
do that.

The consul banged the table and said,

"If you've got no passport you're officially dead":

But we are still alive, my dear, but we are still alive

Went to a committee; they offered me a chair

Asked me politely to return next year:

But where shall we go to-day, my dear, but where shall
we go to-day?

Came to a public meeting; the speaker got up and said:
"If we let them in, they will steal our daily bread":
He was talking of you and me, my dear, he was
talking of you and me.

I thought I heard the thunder rumbling in the sky;
It was Hitler over Europe, saying, "They must die":
O we were in his mind, my dear, O we were in his
mind.

Saw a poodle in a pocket fastened with a pin.
Saw a door opened and a cat let in:
But they weren't German Jews, my dear, by they
weren't German Jews

Went down the harbour and stood upon the quay,
Saw the fish swimming as if they were free:
Only ten feet away, my dear, only ten feet away.

Walked through a wood, saw the birds in the trees;
They had no politicians and sung at their ease:
They weren't the human race, my dear, they weren't
the human race.

Dreamed I saw a building with a thousand floors.
A thousand windows and a thousand doors:

Not one of them was ours, my dear, not one of
them was ours.

Stood on a great plain in the falling snow;
Ten thousand soldiers marched to and fro:
Looking for you and me, my dear, looking for you
and me.

About Poet:

Wystan Hugh Auden (21 February 1907 - 29 September 1973) was a British American poet. applauded especially for his technical and stylistic achievements and for his ability to write in any form of verse. He rose to fame with 'Poems' published in the year 1930. His most notable works include 'Funeral Blues', 'September 1, 1939', 'The Age of Anxiety' and 'For the Time Being'. He won the Pulitzer Prize in Poetry in 1947 for 'The Age of Anxiety'. A man both controversial and influential Auden died in the 1973 of natural causes.

About Refugee Blues:

This poem was written in 1939. The poem describes the condition of Jewish refugees during the period of Nazi Germany, with a particular emphasis on how they were discriminated against and antagonized. On the eve of World War II, the poem meditates on

the plight of Jewish refugees forced to flee Nazi Germany, but unable to find refuge elsewhere. As the poem does so, it raises broader questions about isolation, loneliness, and exile. It depicts the trauma and pain of being forced to leave home and of being unable to find a place of safety and security in a violent and uncertain world.

"REFUGEE BLUES" SUMMARY

The speaker of the poem says that the current city he is in has ten million people. Some live in great mansions while some live in poor holes. In neither dwelling, there is a place for him and his companion.

We used to belong to a nation, and we thought it was beautiful. If you look in the atlas, you'll see it. But we can't go there anymore, my dear, we can't go there anymore. An old yew tree grows outside the village church. Every spring, it blossoms again. But our old passports don't blossom in the spring, my dear, they don't blossom in the spring. The immigration official slammed his fist down on the table and shouted, "If you don't have a passport, then you're legally dead, "But we're still living, my dear, we're still living.

I went to a committee for help and they told me to take a seat then told me to wait until

next year. But where will we go right now, my dear, where will we go right now? I went to a political rally where the speaker said: "If we let the refugees enter our country, they'll take our food." He was talking about you and me, my dear, he was talking about you and me. I thought I heard thunder in the sky. It was Hitler above Europe, saying, "They must die." He was talking about you and me, my dear, he was talking about you and me.

I saw a poodle wearing a jacket fastened with a brooch. I saw a door open to let a cat in. But these were not German Jews, my dear, they weren't German Jews. I stood on the pier down at the harbor. I saw the fish swimming there and they looked free enough. They were only ten feet away from me, my dear, only ten feet away. I went for a walk in the woods and saw birds in the trees. They don't care about the politicians; they sang freely. They weren't human beings, my dear, they weren't human beings.

In my dream, I saw a building a thousand stories tall. It had a thousand windows and a thousand doors. But not one of them belonged to us, my dear, not one belonged to us. I stood in a big field in the falling snow, while ten thousand soldiers marched back and forth, looking for us my dear, looking for us.

Despite this direct and dire threat, the speaker cannot find refuge elsewhere. The speaker seeks asylum in an unnamed country in Europe or the Americas, but that country frustratingly turns the speaker away on a technicality: the speaker's passport is expired. An immigration official announces: "If you've got no passport you're officially dead." Without the proper documentation, the speaker is unable to enter the country a country that could save the speaker's life.

For the speaker, this refusal is both hypocritical and cruel. It is hypocritical because the country has no trouble housing other people. As the poem opens, the speaker complains "there's no place for us, my dear", even though the "city" where they find themselves has managed to find homes for "ten million", with "mansions" for the rich and "holes" for the poor. Indeed, the inhabitants of the city seem more willing to help animals than these refugees: they give comfort and welcome to "poodle" and "cat"; they even dress their dogs in fancy "jacket" to keep them warm! Thus even though they do not announce their anti-Semitism with the same force as the Nazis, their behavior reveals it: they act as though the lives of animals are more valuable to them than the lives of Jews.

And it is cruel because, without protection, the refugees face certain death. The poem closes with the

refugees standing on a "great plain in the falling snow". They have nowhere to hide. And there are "ten thousand soldiers", hunting for them. The speaker thus predicts that without refuge, Jews will be slaughtered. The poem blames the soldiers for their brutality and inhumanity justifiably so, since they are purifying and killing innocent people. But it also strongly suggests that the countries that turn the speaker away share a good deal of the blame and responsibility: they had the power to save the speaker, and failed to do so.

"Refugee Blues" is, in part, about the fear and desperation of being a refugee. The speaker is terrified of returning to Germany, but also is unable to find a safe haven elsewhere. As a result, the speaker is isolated and in limbo, trapped between countries without a clear sense of home. The speaker does not hold out hope that this situation will get better, and the poem uses the speaker's despair and frustration to convey the loneliness, pain, and sense of stagnancy that accompany exile.

Throughout "Refugee Blues", the speaker's mood is bleak and mournful. The poem begins with the speaker complaining that "there's no place for us, my dear" no safe home in any country. And no one will help the speaker: indeed, the people in the "city" would rather take in dogs and cats than Jewish refugees. The speaker thus feels friendless, profoundly lonely.

And without the possibility of finding asylum in a country like England or the United States, the speaker feels trapped. Even fish have more liberty than the speaker: they can at least "swim...as if they were free." At points, the speaker seems jealous of animals and birds because they don't have to deal with hateful "politicians" they experience a kind of happiness and "ease" that the speaker no longer can.

The speaker seems to have given up on changing the minds of such politicians even though they have the power to change the laws that exclude Jewish refugees. The poem does not directly address the countries and governments that refuse to grant asylum the speaker. Instead using apostrophe, the speaker addresses another refugee, someone the speaker simply calls 'my dear'. Instead of calling for, say, specific policy reforms, the speaker simply expresses sadness and frustration. Indeed, the speaker seems to have fled into despair. For the speaker the poem is cathartic, a way for these refugees to get some of the weight of their situation off their chest. But for the reader, it has a different effect: the speaker's suffering and loneliness acts as a powerful call for action, an impassioned demand for change. By providing a window onto the speaker's suffering, the poem makes a passionate case for more just and welcoming immigration laws.

ANALYSIS:

Throughout the poem, which has 12 stanzas, the last line of each stanza contains a repetition. This is emphasize the content of the stanza, mostly on how the Jews were discriminated against and denied basic rights. The rhyme scheme AAB gives the poem a sort of ping-pong characteristic. But there is no doubt that the matter portrayed in the poem is a serious one.

This seriousness kicks in right from the first stanza which says there is no place for a Jew among the rich or the poor. One can understand there is no place in either one of the categories but when it is both, it is understood the situation is very dire. In the second stanza, 'Look at the atlas and you'll find it there' implies that the place which the author called was for him now but a drawing on the map. It wasn't real for him anymore because there was no safety there. The dire situation of the Jews is still emphasized by the situation of their pass-pacts. There is some imagery here using a cemetery and a gey, but the point here is their passports expired and the officials weren't willing to give them new passports. They were trapped and as the consul said; 'they were officially dead'. To be dramatic, they were dead men walking.

Further the people were against them too;

afraid that they coming would mean the native people's shoe would go down. There was fear everywhere in their old home, in their new refugee. There was no one they can turn to nor trust. Thunder was said to be rumbling in the sky. Thunder here by the order of Hitler that all the Jews be killed. The reference is apt as thunder comes before lightning. The lightning here would be the deadly sticks and bullets aimed at the Jews. Throughout the poem, the speaker speaks to another human, presumably a female companion. He says 'my dear' repeatedly showing that him, a Jew is caring and compassionate. This emphasis on the human and loving nature of the speaker gets further sympathy from the readers for the Jews.

Central Idea of the poem Refugee Blues:

This poem gives a pretty accurate description of the situation of Jews in Hitler's rule. It is to show the people the plight of their fellow humans, and how just because they were Jews they were denied basic rights. It is an indirect appeal to show compassion by emphasizing that they were humans too, the same as the readers.

Tone of the poem:

The tone of the poem is melancholic. It is depressing and devastating. The dire plight of the Jews is presented starkly, making the readers uncomfortable, which is its idea.

CONCLUSION:

W H Auden shakes the heart of the reader by presenting the almost brutal situation of the Jewish refugees. Written in a time when the war and hurt were all real, Auden tries to get sympathy and compassion from the readers towards the Jews. He also shows the depth humans can fall to in their cruelty and how indifference too was a cruelty in itself. He shows the human nature of Jews and how they wish to be free and safe, like any other.

LITERARY DEVICES:

Every line of "Refugee Blues" is end-stopped. The poem never uses enjambment. The end-stops in the poem contribute significantly to this rhythm and, at the same time, underline the sense of isolation and exclusion the speaker feels. The end-stops contribute to the rhythm of the poem by making each line feel definite and complete. Sometimes, this emphasizes the poem's rhymes making them sing out more clearly and distinctly.

But of course, not all the lines in the poem rhyme. The third line of each stanza doesn't rhyme at all. These lines feel lonely, isolated, cut-off. The end-stops contribute to that sense of isolation - since they work to further separate those lines from the rest of the poem.

STANZAS:

There is a total of 12 stanzas each having 3 lines in the poem.

RHYME AND RHYTHM: The rhyme scheme is AAB. The last words of the first two lines of each stanza rhyme with each other.

IMAGERY: There is some imagery when the speaker speaks of the yew in the churchyard blossoming in spring each year. "In the village churchyard there grows an old yew,
Every spring it blossoms anew:

METAPHOR: The thunder rumbling in the distance is a metaphor for the orders of Hitler which read "Kill all Jews".

REPETITION: The last line of each of the 12 stanzas has a part of it repeated in itself. For example, 'only ten feet away, my dear, only ten feet away'. This repetition is effective in emphasizing the content of the individual stanzas.

ALLUSION: There is no direct sentence stating the extent of damage done to the Jews nor is there any verse saying the speaker is speaking to a female companion. These are understood by the speaker's words and descriptions.

ಹಂಡಿಗಳ ನೀತಿಯು ಸ್ಥಾನ ಸುಲಕ್ಷಣೆಗಳಿಂದ

① ರಾಯ ಭಾರತ್ವಿಂ

⇒ ರಾಯ ಭಾರತ್ವಿಂ ಕಾರ್ಯದಾಳನ್ನು ವಿವರಿಸಿ ~

ಕಾರ್ಯದಾಳನ್ನಿಂ

1) ಪ್ರೊತ್ತಿನಿಧಿಂಃ ~ ರಾಯ ಭಾರತ್ವಿಂ ಪ್ರಮುಖ ಕಾರ್ಯವು ಮಂದಿರ
ಹಂಡಿಗಳಲ್ಲಿ ಪ್ರೊತ್ತಿನಿಧಿನುವುದು. ಹಂಡಿಗಳಲ್ಲಿ ರಾಯ ಭಾರತ್ವಿಂ
ತನ್ನ ದೇಶದ ಜನತೆಯ ಪ್ರೊತ್ತಿನಿಧಿಯನಿರ್ದೂನೆ. ತನ್ನ ರಾಜ್ಯಕ್ಕೂ,
ತನ್ನ ದೇಶದ ಜನತೆಯ ಪ್ರೊತ್ತಿನಿಧಿಯ ಕಾರ್ಯಕ್ರಮನ್ನು ಯೋಗ್ಯ
ತನ್ನ ಸರ್ಕಾರದ, ತನ್ನ ಜನತೆಯ ಕಾರ್ಯಕ್ರಮನ್ನು ಯೋಗ್ಯ
ಪ್ರೊತ್ತಿನಿಧಿನುವುದು ಮಾತ್ರ ಕಡೆ ವಾಗಿದೆ.
ಉತ್ತರವ್ಯಾಪ್ತಿ ತನ್ನ ರಾಜ್ಯಕ್ಕೂ ತನ್ನ ರಾಜ್ಯಕ್ಕೂ ಹೀಗೆ ಈಗಿಕೆ
ಉತ್ತರವ್ಯಾಪ್ತಿ ಅನ್ನು ಅಳುವುದಲ್ಲಿ ತನ್ನ ರಾಜ್ಯಕ್ಕೂ ಹೀಗೆ ಈಗಿಕೆ
ಉತ್ತರವ್ಯಾಪ್ತಿ ಅನ್ನು ಅಳುವುದಲ್ಲಿ ತನ್ನ ರಾಜ್ಯಕ್ಕೂ ಹೀಗೆ ಈಗಿಕೆ.

2) ಸಂಧಾನಕಾರ್ಯ : - ಹಾರ್ಮರ್ ಕಿ ಫೆರ್ಟನ್ಸ್ ಕ್ರೀಡರುವೆಂಬ
ಸಂಧಾನ ಮತ್ತು ರಾಯ ಭಾರತ್ವಿಂ ಸಾಮಾನ್ಯ ಶಾಂತಿಕ್ರಾಂತಿ
ಬ್ರಹ್ಮಾಂದಿನ್ ಅಂತಿಮ ಕಾರ್ಯಕ್ರಮನ್ನು ಸ್ಥಾಪಿಸುವ
ಸರ್ಕಾರಗಳ ನಡ್ವೆ ಸಾಮರಸ್ಯ ಸಾಧಿಸುವುದು ನಡೆಸುವ
ತಂತ್ರವೇ ರಾಯ ಭಾರತ್ವಿಂ ಎಂದು ಕ್ರೀಡರುವುದು. ಈ
ಸಾಮರಸ್ಯವನ್ನು ಸಂಧಾನದ ಮೂಲಕ ಸಾಧಿಸಲಾಗುತ್ತದೆ.
ಸಾಮರಸ್ಯವನ್ನು ಸಂಧಾನದ ಮೂಲಕ ಸಾಧಿಸಲಾಗುತ್ತದೆ. ರಾಯ ಭಾರತ್ವಿಂ
ಅನಾದಿ ಆಲಕಿಂದ್ಯಾ ಸಂಧಾನ ನಡೆಸುವುದೇ ರಾಯ ಭಾರತ್ವಿಂ
ಪ್ರಮುಖ ಕಡೆ ವಾಗಿದೆ.

3) ವ್ಯಾಖ್ಯಾಸಿತ್ವಾನುವುದ್ದಿಂ : - ರಾಯ ಭಾರತ್ವಿಂ ಅಸಾಮ
ರಾಜ್ಯದ ವಿದ್ಯಾರ್ಥಿಗಳನ್ನು ತನ್ನ ಅರ್ಥನಾಡಿ,
ತನ್ನ ಸರ್ಕಾರಕ್ಕೂ ವರದ ಮಾಡುವುದು ಈನ ಪ್ರಮುಖ

ಕರ್ತವ್ಯ ನಾಗಿದೆ. ರಾಯಭಾರಿಯು ಮೂಲಕ ಒಂದು ದೇಶದ ಹೊಳೆಯಾಗಿ ವಿವರಗಳನ್ನು ಶಿಖಲು ಸಹಾಯಕವಾಗುತ್ತಾದೆ. ಇದು ಒಂದು ರಾಯಭಾರಿಯನ್ನು ತನ್ನ ದೇಶದ ಕ್ಷೇತ್ರ ಮತ್ತು ಕಿರಿಯನಿಂದಿಲ್ಲದ ಮಾಡುತ್ತಾನೆ ಎಂದು ದೇಶದರು ತಪ್ಪಿಗಳರಿಗೆ ರಾಯಭಾರಿ ಸಹಿ ಸುವರ್ಚಿತಗಳು ತನ್ನ ದೇಶದ ಕರ್ಮಾಂಗ ನೀತಿಯನ್ನು ಕಣ್ಣಿ ವಸ್ತುವಿನ್ನಿಂತೆ ವಿನೋದಿಸಿದ್ದಾರೆ.

4) ರಾಷ್ಟ್ರಕಾರಿಯಾಸ್ತಕ್ಯಾಯ ರ್ಹಿತಃ-

ರಾಯಭಾರಿಯು ಮತ್ತೊಂದು ಪ್ರಮುಖ ಕಾರ್ಯದ ಚಂದ್ರ ವಿನೋದ ವಿನೋದದಲ್ಲಿ ತನ್ನ ರಾಷ್ಟ್ರಕಾರಿಯಾಸ್ತಕ್ಯಾಯ ಸ್ವಾವಲ್ಮೀಕರಣ ಮತ್ತು ಸ್ವಾಧೀನ ನಿರ್ವಹಣೆಯ ನಿರ್ವಹಣೆ ರ್ಹಿತಿಗೆ ಸ್ವಾಧೀನ ಕೊಂಡು ಫೈಲಾರ್ಥ್ಯಾನಾಗಿ ನಿರ್ವಹಣೆ ರ್ಹಿತಿಗೆ ಸ್ವಾಧೀನ ಕೊಂಡು. ಇದರು ಸ್ವಾಧೀನ ಮತ್ತು ಸ್ವಾಧೀನ ಕೊಂಡು ವ್ಯಾಧಿಯಾಗುವಂತೆ ಮಾಡಬೇಕು ರಾಷ್ಟ್ರಕಾರಿಯಾಸ್ತಕ್ಯಾಯ ಸ್ವಾಧೀನ ವ್ಯಾಧಿಯಾಗಿರಬಹುದು, ಅಥವಾ ರಾಯಭಾರಿಯು ದೇಶದ ವ್ಯಾಧಿಗಳಾಗಿರಬಹುದು, ಅಥವಾ ರಾಷ್ಟ್ರಕಾರಿಯಾಸ್ತಕ್ಯಾಯ ಸ್ವಾಧೀನ ವ್ಯಾಧಿಗಳಾಗಿರಬಹುದು, ಅಥವಾ ರಾಷ್ಟ್ರಕಾರಿಯಾಸ್ತಕ್ಯಾಯ ಸ್ವಾಧೀನ ವ್ಯಾಧಿಗಳಾಗಿರಬಹುದು. ಇವರೆಲ್ಲ ರಾಯಭಾರಿಯಾಸ್ತಕ್ಯಾಯ ಸ್ವಾಧೀನ ವ್ಯಾಧಿಗಳಾಗಿರಬಹುದು ನೀರಿರಿದ್ದಾಗಿ ರಾಯಭಾರಿಯ ಕರ್ತವ್ಯ ರ್ಹಿತಿಗೆ ನಿರ್ವಹಣೆ ಮಾಡಬೇಕು. ಇವರೆಲ್ಲ ಉದ್ದೇಶ ಮಾಡಬೇಕಾಗಿದ್ದ ರಾಯಭಾರಿಯಾಸ್ತಕ್ಯಾಯ ಸ್ವಾಧೀನ ವ್ಯಾಧಿಗಳಾಗಿರಬಹುದು ನಿರ್ವಹಣೆ ಮಾಡಬೇಕಾಗಿದೆ.

ಬ್ರಹ್ಮಸಂಘರಃ:- ಒಂದುದೇಶದ ರಾಯಭಾರಿಯ ಕರ್ತವ್ಯ ಸ್ವಾಧೀನ ವ್ಯಾಧಿಗಳಾಗಿರಬಹುದೆ. ರಾಯಭಾರಿಯು ಬ್ರಹ್ಮಸಂಘರಃ ದ್ವಾರಾ ಸಂದರ್ಭದಲ್ಲಿ ತನ್ನ ಅಂತರ್ನಾಗಿನ ಕರ್ತವ್ಯಗಳಾಗಿದ್ದಂತೆ ಕಾರ್ಯದ ನಿರ್ವಹಣೆ ಮಾಡಬೇಕಾಗಿದೆ. ರಾಯಭಾರಿಯು ದ್ವಾರಾ ಸಂಭಂಧ ಕ್ಷಿಪ್ರಸ್ವಾಧಿ ಮಾಡಬೇಕಾಗಿದೆ.

೨) ರಾಯ ಭಾಗಾಳ ಹೆಸ್ತೆನ್ನು ಸುವರ್ಪು ಉಪಯೋಗಿಸು
ಹಿದೆಗಳಿಂದ?

ಉಃ - > ಮೈಲ್ ಹೆಸ್ತೆನ್ನು ರಕ್ಷಣೆ :-

ರಾಜು ಅಂತಿಕ್ಕೆ ವರ್ಣಿಸಬಹುದಿಗೆ ಹೇಠಾದ ರಕ್ಷಣೆ
ಖಾಸಗಿ ಒಂಧನದ ವಿಶುದ್ಧ ರಕ್ಷಣೆ ಯೋಜನೆಯ ರಕ್ಷಣೆ
ನೀಡಲಾಗುತ್ತದೆ.

ರಾಯ ಭಾಗಾಳ ಇತನ್ನು ಕುಟುಂಬ ಪರಿಣಾಮ, ರಾಯ ಭಾಗಾಳ
ವರ್ಣದ ಅಧಿಕಾರಿಗಳು, ಸೇವಾ ವರ್ಣದವರು ಯೋಜನೆ
ಇವರಿಳ್ಳಿಗಾಗಿ ಈ ರಕ್ಷಣೆಯ ವ್ಯವಸ್ಥೆ ಅನ್ವಯಿಸುತ್ತಾರೆ.

> ನಿರ್ವಾಸಕ್ಕೆ ಸಂಬಂಧಿಸಿದ ರಕ್ಷಣೆ :-

ನಿರ್ವಾಸವನ್ನು ಇತನ್ನು ತಾಯಿ ನಾಡಿನ ಸ್ಥಾನದ್ದು ಎಂದು
ಪ್ರಾರಂಭಿಸಲಾಗುತ್ತದೆ. ರಾಯ ಭಾಗಾಳ ನಿರ್ವಾಸವನ್ನು ಗಳಿಗೆ,
ಕೆಂಪಿ ಮಂಡಿನ್ನಾಗಿ ಮೌರಿಸುವೆಂಬಲ್ಲ ಹೊಗಲಿಸುವುದು ರಾಜು ಅಂತಿ
ಕೆಂಪಿ ಮಂಡಿನ್ನಾಗಿ ಮೌರಿಸುವೆಂಬಲ್ಲ ಹೊಗಲಿಸುವುದು ರಾಜು ಅಂತಿ
ಕೆಂಪಿ ನಿರ್ವಾಸದ ಒಳಗೆ ಪ್ರಮೋಶಿಸುವೆಂಬಲ್ಲ.

೩) ಕೆಂಪಿ ಮಿನಾಯಿ :-

ರಾಜು ಅಂತಿಕ್ಕೆ ಏನ್ನು ಉತ್ತರಿಸಿದ್ದರೂ ಕೆಂಪಿ
- ಯಾಂದ ಮಿನಾಯಿ ಪದ್ದಿಗಿರುತ್ತದೆ. ರಾಯ ಭಾಗಾಳ ಮೇಲೆ
ಯಾವ ವಿಧಾನದ ಪ್ರತ್ಯೇಕ ಕೆಂಪಿಯನ್ನು ವಿಧಿಸುವೆಂಬಲ್ಲ
ಮಧ್ಯಾಳ್ಯಕ್ಕೆ ಇನ್ನು ನೀಡಿನ ಕಂಡಾಯವನ್ನು ಮತ್ತು ಕಂಡುಬಿಡು

೪) ಸ್ವೇಚ್ಛಾ ಮತ್ತು ಕ್ರಿಯಾನ್ವಯ ಕಾನೂನುಗಳ ವ್ಯವಸ್ಥೆಯಾಂದ
ಮಿನಾಯಿ :-

ರಾಜು ಅಂತಿಕ್ಕೆ ಕೆಲಸ ಮಾಡುತ್ತಿರುವ ದೇಶದ
ಸ್ವೇಚ್ಛಾ ಮತ್ತು ಕ್ರಿಯಾನ್ವಯ ಕಾನೂನುಗಳ ವ್ಯವಸ್ಥೆಗೆ

ಒಳಪಡುವುದಿಲ್ಲ . ಅಲ್ಲಿನ ಯಾವುದೇ ಸೂರ್ಯಾಸ್ತಾ ಓತನ ಕ್ರಾಂತಿ ಮೊಕ್ಕಾಗೆ ಸ್ಥಾಪಿಸಬಹುದಿಲ್ಲ . ರಾಯಭಾರಿಯು ಕಾನೂನಿನ ವರ್ಣಿಕ್ರಾಂತಿಯಾಗಿ ಅಧಿಕಾರ ಕಾರ್ಯಕ್ರಮ ಏತಾನ್ಯಾದಿ ದ್ವಿತೀಯ ವರ್ಷದಲ್ಲಿ ಕೊಡಗಿದಾಗ ಓತನನ್ನು ಬಂಧಿಸಿ ಓತನ ದೀರ್ಘಕ್ಕೆ ಉಪ್ಪಿಗಳನ್ನು ಮಾಡು

೫) ಧಾರ್ಮಿಕ ಲ್ಭಾಷಾ ಭಾಗಾಂಶ ಸ್ವತಂತ್ರಾಂಶಃ-

ರಾಜ ಆಂತರಿಕರು ಈಗೂ ಅವರ ಸಿಖಿಂದ ವರ್ಗದವರಿಗೆ ಎಲ್ಲ ಪ್ರಯತ್ನ ಧಾರ್ಮಿಕ ಸ್ವತಂತ್ರಾಂಶವನ್ನು ನೀಡಲಾಗುತ್ತಾದ . ಕರ್ಮನಿಷ್ಠವೆನಿಸಿದ ದೇವರನ್ನು ಮೂರಿಸು -ಬಳಸು . ರಾಜ ಆಂತರಿಕ ಔವರ್ಲೋಡಿಲ್ ದೇವತಾನ ಅಧಿಕಾರಿ -ಬಳಸು . ರಾಜ ಆಂತರಿಕ ಶಿಕ್ಷಣ ಸ್ಥಾವರ ವಿವರಾನ ನಿರ್ದಿಷ್ಟ ಮೂರಿಸಿ ಸ್ಥಾಪಿಸಿ ಕೊಳ್ಳುವ ಅವಕಾಶ ನಿರ್ದಿಷ್ಟ ಮೂರಿಸಿ.

೬) ಸಂಪದಕ ಸ್ವತಂತ್ರಾಂಶಃ-

ರಾಜ ಆಂತರಿಕರು ನಡೆಸುವ ಎಲ್ಲ ಪ್ರಯತ್ನ ಪ್ರತಿ ವ್ಯಕ್ತಿಗಾಗಿ ಸಂಪದಗಳ ಸ್ವಾರ್ಥದ ರಕ್ತ ಪ್ರತಿ ವ್ಯಕ್ತಿಗಾಗಿ ಸಂಪದಗಳ ಸ್ವಾರ್ಥದ ರಕ್ತದ ರಕ್ತ - ಸ್ವಾರ್ಥ ಪ್ರದಿಯ ಮುಕ್ತಾಗಿರುತ್ತಾಂ . ಓತನ ಟಿಪ್ಪಾಲನ್ನು ಯಾವ ಸ್ವಾರ್ಥ ಪದಿಯ ಮುಕ್ತಾಗಿರುತ್ತಾಂ . ರಾಜಕ್ಕೆ ಮಾರ್ಯಿತಿಯ ಪ್ರಯತ್ನ ಯಾವ ಸ್ವಾರ್ಥ ಪದಿಯ ಮುಕ್ತಾಗಿರುತ್ತಾಂ . ರಾಜ ಆಂತರಿಕ ಶಿಕ್ಷಣ ಸ್ಥಾವರ ವಿವರಾನ ನಿರ್ದಿಷ್ಟ ಮೂರಿಸಿ ಇವರು ರಾಜ ಆಂತರಿಕ ಶಿಕ್ಷಣ ಸ್ಥಾವರ ವಿವರಾನ ನಿರ್ದಿಷ್ಟ ಮೂರಿಸಿ.

೭) ಸ್ವಾಸ್ಥೀರ್ಜಿ ಯಂತ್ರಾಂಶ ವಾಗಿ ರಕ್ತಾಂಶಃ-

ರಾಯಭಾರಿಯು ಕಾಯಿ ನಿವಿಧ ಹಿತ್ತಾಂಶ ರಕ್ತಾಂಶ ಅತನ ತಾಯ್ತುಡಿನ ನಿಮಿಷ ಯಾವ ಸಂಭಿದಿ - ಸಿದರ ಅಧಿಕಾರ ರಾಜ ಆಂತರಿಕ ಸಂಭಿದ ಕಡಿಮೆ ಕ್ರಾಂತಿ - ಸಿದರ ಅಧಿಕಾರ ರಾಜ ಆಂತರಿಕ ಸ್ವಾಸ್ಥೀರ್ಜಿ ಮಾರ್ಯಾಲು ಸ್ವಾಸ್ಥೀರ್ಜಿ - ಕಿಂದಿನ ರಕ್ತಾಂಶ ನಿರ್ದಿಷ್ಟ ಮೂರಿಸಿ.

3) ಯುದ್ಧದ ಕಾರಣಗಳನ್ನು 34ನಿಂದ

ನಿಂದ 4) ಮಾನಸಿಕ ಕಾರಣಗಳು:-

- ಯುದ್ಧವೂ ಮಾನವರ ಮನಸ್ಸಿನಲ್ಲಿ ಇರಂತೆ
- ನೀತಿಗ್ರಾಹಿ ವಿಂದು ಕೊಳ್ಳಲಿದೆ. ತನಿಖಿತ ಅಭಿಪ್ರಾಯ
ಭಯವೇ ಯುದ್ಧಕ್ಕೆ ಮೂಲಕಾರಣವಿದೆಯಂತೆ ಅಭಿಪ್ರಾಯ
- ಎನ್ನು 'ಹಕ್ಕಾರ್ಥ' ಇವರು ಈಕ್ಕೆ ಪಡಿಸಿದ್ದಾರೆ.
ಮನಸ್ಸಿನಲ್ಲಿ ಮಾರ್ಗ ವಿಂದು ಮಾಡಿನಂತೆ ನಾಯ ಕರ
ಮನಸ್ಸಿನಲ್ಲಿ ಯುದ್ಧವೂ ಅವಕಳಕವೇಸಿದರೆ ಇದು
ಅನಿಯಂತೆ ಒಂದು ವಿಂದು ಅಭಿಪ್ರಾಯವನ್ನು +
ಅನಿಯಂತೆ ಒಂದು ವಿಂದು ಅಭಿಪ್ರಾಯವನ್ನು +
ಈಕ್ಕೆ ಪಡಿಸಿದ್ದಾರೆ. ಸ್ವಾಭಾವಿತಕು : ಮಾನವ ದ್ವಾರಾ ಕವಾಟ
ಮತ್ತು ಮಾನಸಿಕಾಗಿ ಉಧ್ವರಿ ಉದ್ದೇಶ ಇವರು ಕರ್ತಾರಿಯಾಗಿ
ಮತ್ತು ಮಾನಸಿಕಾಗಿ ಉಧ್ವರಿ ಉದ್ದೇಶ ಇವರು ಕರ್ತಾರಿಯಾಗಿ

2) ರಾಷ್ಟ್ರೀಯ ರಾಜ್ಯ ಚಳಿಗಳು :-

- ಪ್ರಪಂಚದ ಪ್ರತಿಯೊಂದು ರಾಷ್ಟ್ರಕೂ ತನಿಂದೇ
ಏದ ದ್ವೀಪ ದ್ವೀಪಗಳನ್ನು, ವಿಧೀಕಾಂತ ನೀಡಿ ಮುಂತಾದನ್ನು
- ಗಳನ್ನು ಸ್ಥಾಪಿಸು. ಇವುಗಳನ್ನು ಸಾಧಿಸುವ ನಿರಂತರ
ಗಳನ್ನು ಸ್ಥಾಪಿಸು. ಇವುಗಳನ್ನು ಸಾಧಿಸುವ ನಿರಂತರ
ಪ್ರಯೋಧಗಳ ಕ್ರಿಯೆಗೆ ತ್ವರಿತ. ಇಂತಹ ದ್ವೀಪ ನಿತ್ಯಗ್ರಾಮ, ನಿತ್ಯಗ್ರಾಮ,
ಒಂದು ರಾಷ್ಟ್ರದ ದ್ವೀಪ ಮತ್ತೊಂದು ರಾಷ್ಟ್ರ ನೀತಿಗೆ ವರುಂಧ
ಬಂದು ರಾಷ್ಟ್ರದ ದ್ವೀಪ ಮತ್ತೊಂದು ರಾಷ್ಟ್ರ ನೀತಿಗೆ ವರುಂಧ
- ವಿರಬಳಿಸು. ಇನ್ನು ರಾಷ್ಟ್ರಗಳ ನಡುವೆ ಈ ಪ್ರೇರಣೆ,
ಕಲಾ ಇವುಗಳನ್ನು ದಾಳಿ ಮಾಡಿ ಹೊಂದು, ಅಂತಹ ವಾಸಿ
ಯುದ್ಧಕ್ಕೆ ಕಾರಣವಾಗುತ್ತದೆ. ಪ್ರಸ್ತುತ ರಾಜ್ಯ ಮೌರ್ಯ
ಯುದ್ಧ ಯಾತ್ರೆ ಬಂದಲಾಗಬೇಕೆಂದು ತರಬೇತಿ ಕೊಂಡು
ಯುದ್ಧ ಯಾತ್ರೆ ನಿರ್ದೀಕಿಸಲು ನಾಧ್ಯಾಯಿಲ್ಲ.

- a) ಪ್ರಕಾರ ಮಾನು ಮತ್ತು ಭಂತಾಂಶ್ಯಾಯ ಕಾನುನು ಹಿಂದಿನ
ಸಾರ್ವಧಿಕೀಯ ಅಧಿಕಾರದ ಪ್ರಕಾರ ಪ್ರತಿಯೊಂದು
ರಾಷ್ಟ್ರ ತನ್ನಯಾತ್ರೆ ಬಂದ ರಕ್ತಾಯ ಮೂಲಕ ರಕ್ತಾಸಿ
- ಕೊಳ್ಳುತ್ತದೆ.

ಪ್ರಾಯಿಂದು ರಾಷ್ಟ್ರಗಳ ಮತ್ತಿಗೆ ಕ್ರಾಂತಿಯನ್ನು ಸ್ಥಾಪಿಸಿದ್ದರು. ಇನ್ನಿತ್ತರ ರಾಷ್ಟ್ರಗಳು ತಮ್ಮ ಕ್ರಾಂತಿಯನ್ನು ಅವುಗಳ ಪ್ರಾಯಿಗಳ ಮತ್ತಿಗೆ ಬಳಸಬೇಕು, ಮಿತ್ತಿಲಾಂಡ್‌ನಲ್ಲಿ ಯಾವುದ್ದಕ್ಕೂ ನಾಳಿಕಾಡಿದಂತೆ ಇನ್ನಾಗು.

b) ಹಂಡಿಮಾನುಜಾರಿಯದ ಖಂಡರ ರಾಷ್ಟ್ರೀಯ ಪ್ರಭಾವ :-
ರಾಷ್ಟ್ರಗಳ ನಡುವೆ ಸುಮಾರು ಒಂಟಾದಗೆ ಅವುಗಳನ್ನು ನಾಂತರ್ಯತವಾಗಿ ಬರಿ ಕಾಂತುವ ಸುಮಾರು ತೆಯನ್ನು ಸ್ಥಾಪಿಸಿರುವ ಖಂಡರಾಷ್ಟ್ರೀಯ ಸುಸ್ಥಿರಣೆಗೆ ಅಭಿಜಾವಕು ಯಾವುದ್ದಕ್ಕೂ ಕೀರಣಾವಾದಿ.

3) ಸ್ವಾಧ್ಯಾತ್ರೆ ಕಾರಣಗಳು :-

ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ ರಾಷ್ಟ್ರಗಳಾದ ಫ್ರೆಂಚ್, ರಾಷ್ಟ್ರ, France, Germany ಇವುಗಳು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ಮತ್ತು ಅಧಿಕದ ರಾಷ್ಟ್ರಗಳಾದ ಹೋತೆ ಅವುಗಳ ಐರ್ಥಿಕ ಮತ್ತು ಆಂತರಿಕ ಖಂಡರಾಷ್ಟ್ರ ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು. ಯಾವುದ್ದಕ್ಕೂ ಅವುಗಳ ಸಂಭಾವನಾದಲ್ಲಿ ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ಮತ್ತು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು.

4) ಅಧಿಕ ಕಾರಣ :-

ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ರಾಷ್ಟ್ರಗಳ ವ್ಯಾಪಕ, ಉಳಿದ್ದು ಕೂಡಿದ್ದರು ಅಭಿವೃದ್ಧಿ ಸ್ಥಾಪಿಸಿದ್ದರು ರಾಷ್ಟ್ರಗಳ ಮೂಲಕ ಕ್ರಾಂತಿನ (ಸುಂಕದ) ತೀರ್ಣಿ ಏಕಾನುವಾದ ಮೂಲಕ ಅಧಿಕ ಉಭವನ್ನು ಪಡೆಯುತ್ತಿದ್ದರು. ಈ ಅರ್ಥಮೂದು ಕಾರಣಗಳಿಂದ ಮನಸ್ಸಿನ್ನು, ಕಲಣಗಳ ಮುಂದು ವರಿದ ಯಾವುದ್ದಕ್ಕೂ ಸಂಭಾವನೆಯನ್ನು ನೀಡಿಸಿದ್ದರು.

5) ರಾಜ್ಯಕ್ರಿಯ ಕಾರಣಗಳು :-

ರಾಷ್ಟ್ರ ನಾಯಕರು ಗಳು ರಾಜ್ಯಕ್ರಿಯ ಕಾರಣಗಳನ್ನು,
ಸ್ಥಾರ ಯಥ್ವವನ್ನು ಹೇಳಿ ಅಂತಹ ಕ್ರಾಂತಿಗಳನ್ನು ತಮ್ಮ
ಅನ್ವಯ ಪಕ್ಷದ ಅನ್ವಯಗಳನ್ನು ಸ್ಥಾಪಿಸಬಹುದಿಲ್ಲ.
ಈ ರಾಷ್ಟ್ರದ ನಾಯಕರು ಗಳು ಯಥ್ವಕ್ಕಾಗಿ ಅಂತಹ ಕ್ರಾಂತಿಗಳನ್ನು
ಇವರಂದಾಗಿ ರಾಜ್ಯಕ್ರಿಯ ಯಾತ್ರಾಕ್ರಾಂತಿ ಕಾರಣಗಳಿಂದ ವಿಕಾಸಿಸಿ
ರಾಷ್ಟ್ರಗಳ ನಡುವೆ ಯುದ್ಧಗಳು ಸಂಭವಿಸುತ್ತಾರೆ.

6) ಶಾಮಾಜಿಕ ಕಾರಣಗಳು :-

ಒಂದು ಸ್ವಾಧಾರಿ ಇರುವ ಬದಲಾವನ್ನು,
ಅನ್ವಯಕ್ಕೆ, ಕಡೆಯ ಕ್ರಮಾಂಕದ ಲಕ್ಷ್ಯನ್ನು ಮಾಡಲಾದ
ಸ್ಥಾರಗಳೀಗೆ ಸ್ಥಾರ ಒಂದು ಮುಕ್ತರಾಜ್ಯಗಳನ್ನು ಮಾಡುವ
ಸಂಭಾವನೆಯ ಅಂಶ. ಇಲ್ಲಿ ಸಂಕ್ಷಿಪ್ತವಾಗಿ ಲ್ರಿಟಾಯಗಳು
ಜೊತ್ತು ನೀಡಿ ಒಂದರನ್ನೇಲ್ಲ ದಿಕ್ಕ ಸ್ಥಾಪಿಸುವ ರಾಷ್ಟ್ರಗಳು
ಅನ್ವಯಾಗ್ಗೆ ಕಾರಣದ ತತ್ವಗಳ ಪಾಲನೆಯ ಮಾಲೆ
ಯುದ್ಧಕ್ಕೆ ಕಾರಣವಾಗುತ್ತಾರೆ.

7) ಸುತ್ತ ಸ್ವಾನಕ ಬಹುಂದರಳಿಗಳು :-

ರಾಷ್ಟ್ರಗಳ ಬಂದರ್ಗೊಂಡ ಇನ್ವಿಟಾಂ ಗಳಿಗೆ
ಸುತ್ತ ಸ್ವಾನಕ ಬಹುಂದವನ್ನು ಮಾಡಿಕೊಂಡಿರುವ ಮೂಲಕ
ಯುದ್ಧಕ್ಕೆ ಪ್ರೋವೆಂಟ್ ಕಾರಣಗಳನ್ನು ಮಾಡಿಕೊಂಡಿರುತ್ತಾರೆ.
ಇದನ್ನು ಮೊನ್ಸ್ಟರ್ ಎಂಬ ತಾತ್ಕಾರ್ಯಗಳ ಪಕ್ಷ
-ಗಳಿಗೆ ಸ್ವಾನಕ ಬಹುಂದಗಳನ್ನು ಮಾಡಿಕೊಂಡಿಲ್ಲ
ಅರಂಭಿಸುತ್ತಾರೆ. ಈ ಪ್ರೋಪ್ರೋಟಿಯ್ ಮೂಳೆಯರಿಂದ
ಯುದ್ಧಕ್ಕೆ ವಡಿಮೊಡಿಕೊಂಡಿರುತ್ತಾರೆ.

8) ಪ್ರಪಂಚದ ಸ್ತಕಾರ್ಥ ಇರುವುದು :~
ಇಂಡಿನ್ ಸ್ತಕ ರಾಮಾರ್ತ್ರಿಗಳ ಸ್ತಕಾರ್ಥವನ್ನು
ಕಡಿಮೆಣಿದಲ್ಲಿ ಇರುವೆಡಿಕೆ ಏಕ್ವಾ ಮೆಟ್ರಿದ ಸ್ತಕಾರ್ಥ
ಇಲ್ಲದೇ ಇರುವು ರಾಮಾರ್ತ್ರಿಗಳ ನಡುವೆ ಉನ್ನಿಕ್ಕ ಕಾರಣದ
- ೪೦ದ ಸಂಭಾಷಣೆಯ ಯುದ್ಧಗಳನ್ನು ತಿಳಿಯು
ಅಂತಾಧ್ಯಾನಿಸಿ.

9) ಇತರೆ ಕಾರಣಗಳು :~
ಬಂದು ರಾಮಾರ್ತ್ರಿ ಅರ್ಥ ಇನ್ಸಂಪ್ಲಿ ಯುದ್ಧ
ಕಾರಣವಾಗಿ ಬಹುದು ಯುದ್ಧಕ್ಕಿಂತ ಕಳವಾಗು ಕಾರಣಗಳು
ಇನ್ನು ನಿರ್ದಿಷ್ಟವಾಗಿ ಇಂತಹದ್ದೆ ಕಾರಣ ಯುದ್ಧಕ್ಕಿಂತ
ನಂಬಿಯಾಗಿ ಬಹುದು ಎಂದು ಈಂಬಹುದು ತಮ್ಮಗಳಿಂದ
ಜನರ ಮನಸ್ಸಿನ ರಾಮಾರ್ತ್ರಿ ವಿಷಯಕ ತತ್ವಗಳು ಬಂದಿನ
ಇಂತಹ ಕಳವು ಕಾರಣಗಳು ಯುದ್ಧಕ್ಕಿಂತ ಮಾಡಿಕೊಂಡು
ಅಂತಹ ಕಳವು ಕಾರಣಗಳು ಯುದ್ಧಕ್ಕಿಂತ ಮಾಡಿಕೊಂಡು

4) ಯುದ್ಧದ ಪ್ರಾಣರ ಮಾರ್ಗಗಳನ್ನು ವಿವರಿಸಿ ?

:- ನಿಶ್ಚಯಿಕರಣ :~
ನಿಶ್ಚಯಿಕರಣ ಯುದ್ಧವನ್ನು ತಡೆಯಲು
- ಲು ಇರುವ ಮತ್ತೊಂದು ಮಾರ್ಗ ಎಂದು ಪ್ರಾಣಿಗಳಿಂದ
- ನು . ಯುದ್ಧ ಮಾರ್ಗ ತಯಾರಿಸಿದ್ದ ತಯಾರಿಸಿದ್ದ ವಲ್ಲ ರಾಮಾರ್ತ್ರಿ
- ಗಳು ನಿಖಳೆ ಮಾರ್ಗ ಯುದ್ಧವನ್ನು ತಡೆಗಟ್ಟಿಬಹುದು.
ಕೀಲವು ರಾಮಾರ್ತ್ರಿಗಳು ಮತ್ತು ಈ ತತ್ವವನ್ನು ಉನ್ನತಪಡಿಸು
- ತ್ವರಿತ. ಇದರಿಂದ ಯಾವ ಫಲವನ್ನು ನಿರ್ದಿಷ್ಟಿಸಲು
ಅಧಿಕಲು ಹಾಗೂ ವಲ್ಲ ರಾಮಾರ್ತ್ರಿಗಳು ಒಮ್ಮೆಕೊಂಡು
ಅಂತಿಮ ನೇಡುಕೊಂಡರೆ ಮತ್ತು ಶಾಂತಿ.

೨) ಶಾಸಕರಣೆಗಳನ್ನು:

ಶಾಸಕರಣೆಗಳನ್ನು ಏಷಿಡ್ ರಾಫ್ಟ್
 - ನಿಜ ಬಲದ ಸಂಪತ್ತಿಗಳನ್ನು ಕಡತಹಿಂಣಿಗಳನ್ನು ದಂಡಿಸಿ. ಇ
 ತತ್ವವು ಯಥ್ವವನ್ನು ನಿರ್ವಾಣಿಸಿ ಗಾಂಡಿ ಸ್ಥಾಪನೆ ಮಾಡುವು
 - ಈಗಲ್ಲ ಸಂಸಾರಯಾರಿಗೆ ಎಂದು ಹೀಳಬಾಲ್ತಾ. ಯಥ್ವಾನ್ನಿ
 ಕೊಡನಾರ್ಥಿಕಾದ್ದರಿಂದ ಪ್ರಕ್ರಿಯೆ ಸಮಾನ ಬಲವನ್ನು ಕೊಂಡಿದ್ದು.
 ಅವನಿಂಜಲ್ಲಿ ನಾನು ಜೀವನ್ನು ವಿಭಿನ್ನ ವಸ್ತುಗಳನ್ನು ಒಳಗೊಂಡಿ
 ಖಚಿತವಾಗಿ ಅವನಿಂಜು ಯಥ್ವವಾಗಿದೆ ಮನ್ನು ಒಳಗೊಂಡಿ
 ತಮ್ಮ ಸಮಾಖ್ಯಯನ್ನು ಗಾಂಡಿಯತನಾನಿ ಬಗ್ಗೆ ಇಂದಿ
 - ಕೊಳ್ಳುವ ಕ್ರಿಯೆ ನಡೆಸುತ್ತಾದೆ

೩) ಸಾಮಾಜಿಕ ಭಾಷ್ಯತ್ವ:

ಸಾಮಾಜಿಕ ಭಾಷ್ಯತ್ವ ತತ್ವದ ಪ್ರಕಾರವಾಗಿ, ಒಂದು
 ಘಟ್ಟಮಣಿಕಾಳ ರಾಷ್ಟ್ರವನ್ನು ಅನೇಕ ಸಂಪನ್ಮೂಲ
 ರಾಷ್ಟ್ರನಿಂಜು ನೀಡಿ ಎನುದಿಸುತ್ತಾದೆ. ರಾಷ್ಟ್ರಗಳು ಸಾಮಾಜಿಕವಾಗಿ
 ಘಟ್ಟಮಣಿಕಾಳ ರಾಷ್ಟ್ರವನ್ನು ವಿರುದ್ಧ ಮಾಡುವ ಮಾಡುತ್ತಾದೆ.
 ಘಟ್ಟಮಣಿಕಾಳ ರಾಷ್ಟ್ರವನ್ನು ವಿರುದ್ಧವಾಗಿ ಎನುಂಬಲಾರೆ,
 ಕ್ಷಾ ಸಾಮಾಜಿಕ ವಿರೋಧವನ್ನು ಎನುಂಬಲಾರೆ,
 ಘಟ್ಟಮಣಿಕಾಳ ರಾಷ್ಟ್ರವು ಯಥ್ವವಾಗಿ ಮಾಡುವ ತನ್ನ ಯೋಜನೆ
 - ನೆಯನ್ನು ಕ್ಷಾ ಒಂದು ಬಂದು ಓದುದಂದೆ ಸಾಮಾಜಿಕ
 ಭಾಷ್ಯತ್ವ ಯಥ್ವವನ್ನು ನೀಡಿಸಿ ಬಿಲ್ಲಿ ಬಂದು
 ಸಾಧನವಾಗಿದೆ.

೪) ಯಥ್ವ ಸಾಂಸ್ಕರಿಕತ್ವ:

ಯಥ್ವದ ರಾಷ್ಟ್ರಗಳಲ್ಲಿ ತಾವು ಯಥ್ವ ಕಾರಣಕ್ಕಾಗಿ
 ಯಥ್ವ ಮಾಡುವುದಿಲ್ಲ ಎಂದು ತಮ್ಮ ಲ್ಲಿ ವಿವಾಧಿಸಿನ್ನು
 ಗಾಂಡಿಯತನಾನಿ ಬಗ್ಗೆ ಸಂಸಾರಕ್ಕೊಳ್ಳುತ್ತೇ ಏಂಬು ಹಣಿವನ್ನು
 ತೊಂದ್ರಿಯ ಯಥ್ವ ಸಿನ್ಹಾ ಸಾಂಸ್ಕರಿಕವನ್ನು ಕ್ರಿಯೋಧಿ ಯಥ್ವವನ್ನು

ಸಂಭವ ಕಡೆಯೇ ಯನ್ನ ಅನ್ವಯ.

5) ವಿರುದ್ಧ ಸೂಕ್ತದರ್ಶ :-

ನ್ಯಾಯ ಮತ್ತು ನಾಗರಿಕ ಸಂಖ್ಯಾದಲ್ಲಿ ಕ್ರಮಾಗಳನ್ನು ವಿವರಿಸಿದೆ. ಇದನ್ನು ವಿವರಿಸಿದ ಪ್ರಕ್ರಿಯೆಯನ್ನು ಕ್ರಿಯಾಗ್ರಹಣ ಎಂಬುತ್ತಾರೆ. ಈ ಪ್ರಕ್ರಿಯೆಯ ಲಕ್ಷ್ಯವು ನಾಗರಿಕ ಸಂಖ್ಯೆಯ ವಿವರಣೆಯನ್ನು ಕ್ರಿಯಾಗ್ರಹಣ ಮಾಡಲು ಇದೆ. ಇದನ್ನು ವಿವರಿಸಿದ ಪ್ರಕ್ರಿಯೆಯ ಲಕ್ಷ್ಯವು ನಾಗರಿಕ ಸಂಖ್ಯೆಯ ವಿವರಣೆಯನ್ನು ಕ್ರಿಯಾಗ್ರಹಣ ಮಾಡಲು ಇದೆ. ಈ ಪ್ರಕ್ರಿಯೆಯ ಲಕ್ಷ್ಯವು ನಾಗರಿಕ ಸಂಖ್ಯೆಯ ವಿವರಣೆಯನ್ನು ಕ್ರಿಯಾಗ್ರಹಣ ಮಾಡಲು ಇದೆ.

6) రస్తా స్తున్ధన్య + విపరీతి సూచన్మః ~

6) ರಾಷ್ಟ್ರೀಯ ಪಕ್ಷದ ಪ್ರಮಾಣದಲ್ಲಿ ನನ್ನ ಸ್ತಂಭನ್ನು
ರಾಷ್ಟ್ರೀಯ ಪಕ್ಷದ ಪ್ರಮಾಣದಲ್ಲಿ ನನ್ನ ಸ್ತಂಭನ್ನು
ಹೀಗಾಗೆ ಮಾಡಿಕೊಳ್ಳುವ ಕಿರಣಗಳಿಂದ ಬಳಾಕು ಯಾಂತ್ರಿಕ

Agastya Samhita Experiment

"Place a well cleaned copper plate in an earthenware vessel cover it first by Copper Sulfate and then by moist sand-dust, After this put a mercury - amalgamated zinc sheet on top of the sand-dust to avoid polarization, The contact will produce an energy known by the twin name of Mitra - Varuna, water will be split by this current into Pramanavayu and Sudhanavayu.

A chain of one hundred jars is said to give a very effective force".

Introduction of Rishi Agastya

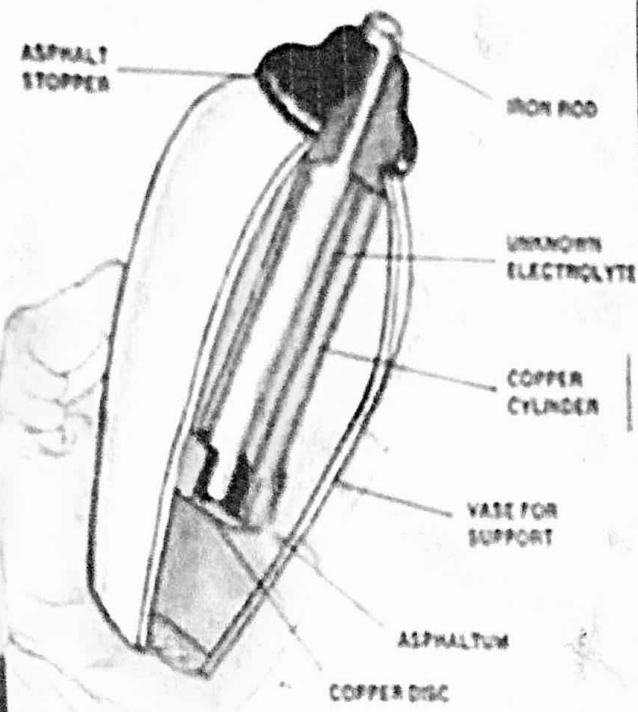

Rishi Agastya is one of the Seven Saptrishis,

According to Puranas, he was born in a kumbh (pitcher) from the Semen of Varuna & Mitra. He is considered the father of Tamil literature. He is attributed many mantras of the first Veda, the Rigveda. He made a pioneering contribution in the field of Ayurveda and Jyotish. Lalita Sahasranam, which praises the Goddess through her thousand names was revealed to Sage Agastya.

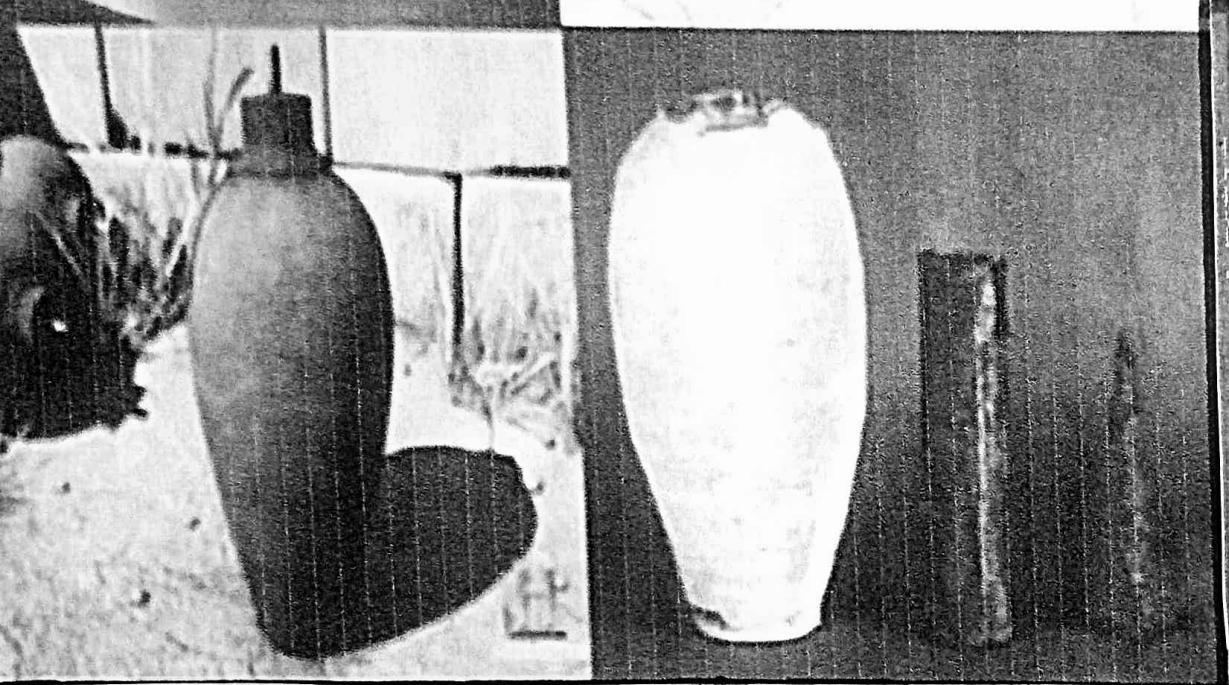

by Hayagriva, an incarnation of Lord Vishnu. Aditya Hridyam, a hymn to Surya Deva, was composed by sage Agastya. He taught it to Shri Ram just before war with Ravan. He also composed the Saraswat Stotram. According to Ramayana, he is a unique sage, short and heavy in built, who by living in South, balances the powers of Lord Shiv and weight of Kailash and Mount Meru.

Lord Ram stayed at Agastya Ashram during his exile. The sage gave him three gifts: a bow made by Vishvavarma for Lord Vishnu, an inexhaustible quiver and a sword. He killed demons Ucatapi and Ilwala after they jointly milled and destroyed 9,000 men. He is regarded as the founder and patron saint of Silambam and Kurmanan ancient science of healing and the Southern martial art - Kalariipayat, which he learnt from Lord Kartikeya himself.

Formation of Primary & Secondary rainbow

Primary rainbow results in three steps process which are refraction, reflection & refraction. The small drop acts as a prism. It can be explained with the help of two drops. We see that red light from drop 1 & violet light from drop 2 reach observer's eye. In this case, violet light from drop one & red light from drop 2 are directed at different levels. As a result, the observer sees a rainbow with red color at the top & violet color at bottom.

Secondary rainbow as in fig (b) is formed in four step process refraction, reflection, reflection & refraction. When light rays undergo reflection twice inside the drop, then secondary rainbow is formed. Hence intensity of light is reduced at secondary reflection, therefore, secondary rainbow is fainter than primary one. Moreover the order of color get reversed in case of secondary rainbow.

Topic :- zoology assignment

To,

Department of zoology
D.V.S college of arts
and science.

Paper - III - Ecology, Ethology and Biodiversity.

Auction paper Number - 01

I Answer any five of the following questions.

1) What is Mutualism, give an example.

→ It is an association between two organisms belonging to different species, where both depend on each other and cannot live without the association.

ex:- Lichen :- The association of algae and fungi together forms lichen, where algal member (phycobiont) supplies food whereas fungi (mycobiont) provides protection, water and minerals to algae.

2) what are Lentic and lotic ecosystem?

→ The lentic ecosystem is the freshwater ecosystem which includes all standing water bodies like lakes, ponds, swamp or bog.

The lotic ecosystem is also the freshwater ecosystem which includes running or flowing water bodies like Rivers, springs, and creek. the subject of study of freshwater ecosystem is known Limnology.

3) what is Natality and Mortality?

→ Natality is also known as birth rate. It is the rate of production of new individuals per unit of population per unit time through birth, hatching, germination or vegetative propagation. Natality (birth rate) is calculated as number of births in a year per thousand individual.

$$\text{Natality} = \frac{\text{Number of birth}}{\text{Total no. of individual in population}} \times 1000$$

The Mortality refers to the death rate. The ratio of the total number of deaths to the total population, the ratio of deaths is an area to the population of that area, expressed per 1000 per year.

- 4) what are endangered species ? give an example.
→ A species of animal or a plant that is seriously at risk of extinction is called endangered species.
eg:- slender, deer, great Indian Bustard

- 5) State I and II law of thermodynamics?
→ 1st law :- energy can be changed from one form to another, but it cannot be created or destroyed, the total amount constant, merely changing from one form to another.

2nd Law = In all energy exchange if no energy enter or leave the system, the potential energy of the state will always be less than that of initial state.

- 6) Mention any two Biosphere reserve of India?
→ Nameri Biosphere, Gulf of Mannar, Nanda Devi.
- 7) Expand IUCN and GIS?
→ IUCN - International union for conservation of nature
GIS - geographic Information system

II Answer any four of the following questions:

- q) Mention the Application of GPS in ecosystem?
GPS is made up of three parts, satellite orbiting the earth, control and monitoring stations on earth, and GPS receiver.
→ Space segment :- constellation of operating satellite that transmit one way signals that give position and time.
→ control segment - consist of worldwide monitor and control stations that maintain the satellite in their proper orbits.

User segment :- consist of the GPS receiver equipment which receives the signals from the GPS satellites and use the transmitted information to calculate the user 3D position pt.

- To sustain the earth's environment exhibit while belonging human needs requires better planning with more update information, the global positioning system helps in gathering accurate and timely information about our environment.
- GPS data collection system is helpful to make analysis of environment issues, environmental pollution and travels.
- GPS technology helps to understand and forecast changes in the environment
- GPS + Polar tracking and measurement helpful to assess the effects of ocean tides.

10) Explain law of limiting factors?

→ 3 laws of mechanism of law of limiting factors

1) Law of minimum :- The law was proposed by Liebig in 1850. Here organisms are exposed to a variety of environmental factors, certain factors are present in the smallest quantity.

According to Liebig - growth and reproduction of organisms are depend on the factors that are present in minimum quantity in the environment this is called law of minimum.

2) Law of tolerance / Shelford's Law of tolerance

This law was proposed by Shelford in 1973.

He noted a weakness or draw back in Liebig's law and proposed law of tolerance, According to this law organism are exposed to a variety of environmental factors like light, temperature, nutrients etc.

3) combined concept of limiting factors:- This law was proposed by Odum in 1971. It states that "the presence and success of an organism or a group of organisms depend on a complex of conditions - the organisms are controlled in nature by";

- (a) the quantity and variability in materials for which there is a minimum requirement.
- (b) the limits of tolerance of the organism themselves to their factory and other components of the environment.

11) write a note on ecological succession?

→ orderly, directional replacement of communities from one kind to others during course of time due to the changes in physical environment called ecological succession.

Main features of ecological succession:-

- ecological succession is gradual, slow and continuous process till the emergence of stable community - climax community.
- entire sequence of community during ecological succession is called series.
- First community appears during ecological succession called the pioneer community.
- pioneer community → several communities - climax community.

characteristics principles of courtship behaviour.

- courtship is a heterosexual communication leading to the act of mating.
- courtship display is an extension of the male-male competition in which male evolved various devices and techniques to persuade female to produce, hence males play an active role in courtship + initial sexual interaction.
- nature of courtship behaviour varies greatly among animals, in most of the cases it contains the element of conflict b/w male and female or b/w two males.
- courtship behaviour decrease after successful mating. It also decreases during ill health / physical weakness.
- Among seasonal breeder courtship behaviour exhibit during seasons, absent in off seasons (frog shows only during monsoon season).
- A courtship behaviour involving Singing, dancing nesting by many animals.
- courtship is a complex behaviour controlled by several factors, sex hormones play a major role

Courtship behaviour in 3-spined stickleback fish.

Three-spined stickleback fish (gasterosteus) is found in freshwater bodies. Male is bluish-black in colour with red belly while female is always in colour, characteristic courtship behaviour derived in male three-spined stickleback fish involved visual display and nesting are as follows.

- During breeding season male turns into red belly and olive green back and get isolated from groups.
- Male finds a place in sandy bottom where there are weeds, male builds a tunnel-like nest in sand among weeds, algae, roots and stem of water plants, nesting materials glued with mucus

- * After making nest it starts depending to territory around the nest, other males are attached and chased away aggressively.
 - Then male swims near the surface over the nest to invite female, it performs dance in front of moving group of fishes, native female responds to this dance.
 - Male swims upward from below over the nest to invite female. It performs dance, below his dorsal spine, when response of female is positive both of them swim in zig-zag fashion towards the nest. Male shows the entrance of nest by dipping down in front of the nest and pointing head towards nest.
 - If female like the nest it enters inside and male follows, male prompts the female to release eggs.
 - Male then deposits his sperme over the eggs and female is chased away.

16) write a note on .

(a) Desert biome:-

Desert forms $\frac{1}{5}$ of earth's land surface where annual rainfall is less than 50mm. High degree of diurnal temperature fluctuations 5°C - 40°C . hot days and cold nights.

- Low humidity and high rate of evaporation.
- Nutrient poor soil, cannot hold water, less productive desert biota and their adaptations. producer's type annual grasses grow rapid, finish their life cycle within few days after a rainfall, they will remain in seed form during summer, succulents are plant of

12) Explain the parental care in Hippocampus and Racophorus.

→ In hippocampus male take the responsibility of receiving eggs till they hatch, males have abdominal brood pouch for rearing young ones. Broad pouch is formed from fusion of pelvic fins in male. Female lays egg into the broad pouch of male. In seahorse only male undergo a pregnancy, fertilized eggs are placed after courtship. Broad pouch carrying eggs get closed by a flap of skin inside broad pouch get eggs are aeroregulated, nourished by specially adapted structures, highly vascularised veins inside broad pouch maintain temperature required for the development of egg.

In *Racophorus malabaricus* is endemic to the western ghats of India, a bright green coloured frog inhabits evergreen, and doni-evergreen forests and builds arboreal form nests, male makes mating calls by setting on the tree branch near a water source, as a female approaches male grasps female swelling in axillary ampous, female chose the leaf of a tree overhang-ing a water body for spawning, During spawning the female rubs the back for the male by curving her hind limb, the male releases seminal fluid and agitates it to form the foam, later the female holds the leaf containing the foam nest with its forelimbs and starts collecting leaves one after another from the surrounding to cover the foams all around.

13) elucidate the tolerance of some of the thermodynamic energy flow in ecosystem.

→ The laws of thermodynamics govern energy flow energy exists in many forms such as heat, light, chemical energy and electrical energy. Energy is the ability to bring about change or to work. Thermodynamic states that energy cannot be created or destroyed but it can be only changed from one form to another, second law states that in all energy therefore some energy will dissipate as that the heat, the flow of energy maintains order of life. Thus energy loss is constant pattern. In this fact ecosystem have calculated that the percentage of usable energy transferred from one organism to another is 10%, that means that 90% of energy is lost as that heat, so if then only about 1000 cal will be available to support primary consumer and only about 100 calories to support secondary consumer or omnivore. This is also known as 10% law. Energy loss in transfer below trophic level. In the Arctic eskimos hunt whale for food, whale eat tons of microscopic algae. It requires 100 calories of plankton which is what whale use to produce 1000 calories of blubber to its body. Finally this 1000 calories of whale blubber contains enough energy to give eskimo one calorie of energy.

CARNIVOROUS BIRDS...

INTRODUCTION :

"Carnivorous" describes a diet that consists primarily, though not always exclusively, of meat. Food or prey typically includes mammals, birds, insects, amphibians, fish or reptiles, and it is obtained either through hunting or scavenging.

Birds of prey such as hawks, falcons, eagles, osprey, vultures, owl, kite are familiar carnivorous birds. Birds rarely eat just one type of meat, and many will choose whatever prey is convenient or easiest to catch.

Carrion is also a popular food source for carnivorous birds, particularly vultures, and could be a discarded hunting carcass or entrails, road kill or any animal that may have died from a illness, accident or injury.

Some carnivores, such as wolves, hunt in a group called a pack. They move silently and slowly to form a circle around their prey before they attack.

EAGLE...

History :

The Native Indians saw the Eagle as a symbol for great strength, leadership and vision. As if to seemingly mirror this, the eagle has been used to a 'banner' by many of the great empires throughout history, from Babylon to Egypt, through to Rome and even the United States.

In ancient Aztec tradition, the chief god told people to settle at a place where they find an eagle perched on a cactus eating a snake. This place is now Mexico city. The eagle was a strong emblem in the Roman Empire.

Scientific classification

Kingdom : Animalia.

Phylum : Chordata.

Class : Aves.

Order : Accipitriformes

Family : Accipitridae.

Eagle is the common name for many large birds of prey of the family Accipitridae. Eagles belongs to several groups of genera, not all of which are closely related. Most of the 60 species of eagle are from Eurasia and Africa. Outside this area, just 14 species can be found - 2 in North America, 9 in Central and South America, and 3 in Australia.

Biological Characteristics:

Eagles have a beauty and grace fitting their status as our national emblem. As with most birds of prey, the female eagle is larger and heavier than the male. They weigh an average of 12 pounds with a wingspan up to seven feet and a body length of nearly three feet. The bulk of an eagle is its feathers. Its bones are hollow and much lighter than the bones of mammals.

Golden eagles typically have larger bodies and shorter wingspans compared to bald eagles. Adult bald eagles are easily detected by their brilliant white heads and tail feathers and chocolate brown bodies and wings. They have black talons and yellow eyes, beaks and feet. Immature

Bald Eagle's Adaptations:

Eyesight

The bald eagle's eyesight is four to eight times better than that of a human. Eagles also have a bony ridge above their eye that minimizes glare from the sun.

Catching prey

It's crucial to spot your prey, but if you can't grab it you won't be eating dinner. A circle of bumps on the bottom of their feet known as spicules - help them hold on to their prey during flight.

Eating

In addition to talons, they use their meals. They primarily eat fish - although also some birds, mammals and reptiles and their beaks are tough enough to tear and eat the flesh of larger prey bite by bite.

Reproduction in Eagle:

Eagle reproduce by engaging in a courtship process that includes cartwheeling and circling in the air, copulation and nestling, where both the male and female eagle build the nest. Eagles typically mate for life, and they usually use the same nest each year after year as long as they have successfully produced and protected offspring at the location.

while the courtship processes occur while the eagles are flying, copulation typically occurs in the nest. The male mounts the female and the male and female cloaca touch, which is referred to as the cloacal kiss. The female typically lays the fertilized eggs about 5 to 10 days after successful copulation.

KITE ...

History And Habitat:

Swallow-tailed kites breed in swamps, lowland forests, and marshes of the southeastern United States, primarily in Florida and south Carolina. They require tall trees for nesting and open areas full of small prey to feed their nestlings. Nesting and foraging habitat includes slash pine wetlands, edges of pine forest, cypress swamps, wet prairies, freshwater and brackish marshes, hardwood hammocks and mangrove forests.

Swallow-tailed kites are usually found at low elevations, but members of the southern subspecies often breed in sites more than a mile high, given adequately humid conditions.

Scientific classification

Kingdom : Animalia

Phylum : Chordata

Class : Aves

Order : Accipitriformes

Family : Accipitridae

Physical Characters :

Black kites are medium-sized raptors, weighing 560g on average. Body length ranges from 41 to 60cm, with an average wingspan of 140 to 160cm. Their dorsal coloration is mostly brown, which fades to a darker brown towards the tips of the wings and tail.

Black kites have small, broad-like dark brown eyes and a large black, hook-shaped beak for tearing flesh and consuming their prey. The outer edge of their wings appears to be "fingered". Black kites are often called "folk-tailed kites" because of the distinct shape of their tails. Tail coloration is mostly brown, with darker brown striped feathers. Black kites have long black talons and pale yellow legs. Humans have not domesticated kites in anyway.

Introduction

Animal communication is the transfer of information from one or group of animals to one or more other animals that affects the current or future behavior of the receivers. Information may be sent intentionally, as in a courtship display, or unintentionally, as in the transfer of scent from predator to prey. Information may be transferred to an audience of several receivers. Animal communication is a rapidly growing area of study in disciplines including animal behaviour, sociology, neurology and animal cognition. Many aspects of animal behavior, such as symbolic name use, emotional expression, learning and sexual behavior, are being understood in new ways.

Communication is rapidly growing areas of study in disciplines. When the information from the sender changes the behavior of a receiver, the information is referred to as a "signal". Signalling theory predicts that for a signal to be maintained in the population, both the sender and receiver should usually receive some benefit from the interaction. Signal production by senders and the perception and subsequent response of receivers are thought to coevolve. Signals often involve multiple mechanism both visual and auditory, and for a signal to be understood the coordinated behaviour of both sender and receiver require careful study.

Vocal resonance

In most terrestrial mammals the larynx at rest is positioned high up in the throat, but in humans the larynx is positioned relatively low in the neck. In chimpanzees and even more so in other primates, the larynx connects with the nasal passage at rest and its entrance is within the nasal cavity, so that food passes on both sides of the laryngeal tube in the centre of throat.

Although in mammals the food passes and the air passage cross each other in the pharynx the food passage are fully separated most of the time, so that most mammals can swallow fluids and breathe simultaneously.

A lowered larynx is seen in a few aquatic mammals such as dugongs & manatees, but is probably less frequent in terrestrial mammals. Some mammals like red deer, hammerhead bats, walrus and koala, have a permanently low larynx but have evolved a long and elastic velum which connects the nasal cavity with the larynx, when at rest. This is lacking in humans. The larynx or voice box, placed in the thyroid cartilage is a organ in the neck of mammals involved in protection of the trachea and in sound production.

Communication

Communication is simply that act of transferring information from one place, person or group to another. Every communication involves at least one sender, a message and a recipient. This may sound simple, but communication is actually a very complex subject.

The transmission of the message from sender to recipient can be affected by a huge range of things. These includes our emotions, the cultural situation, the medium used to communicate, and even our location. The complexity is why good communication skills are considered so desirable by employers around the world.

As this definition makes clear, communication is more than simple transmission of information. There requires an element of success in transmitting an important message whether information, ideas or emotions. A communication, therefore has three parts the sender, the message and recipient.

The sender encodes the message usually in mixture of words and non verbal communication. It transmit in some way and the recipient decodes it. An effective communicator understands their audience, chooses an appropriate communication channel, tones their message for this particular channel and encodes the message effectively to reduce misunderstanding by the recipients.

Types of animal communication

Animals may not be able to speak in master language techniques, but they certainly able to communicate with one another, their survival depends on it. Animals generally communicate using four methods.

a) Visual communication

Visual communication for animals comes in two forms: badges and displays. Badges, the colour and shape of the animal, are structural adaptations, such as the bright yellow feathers of the male American goldfinch. The bright colours tell a prospective mate the male is a suitable choice. Displays are the behaviors animals exhibit, such as the glow of a firefly to attract mates or when a dog wags his tail to let you know he's happy.

Visual communication is the least effective since the animals must be close enough to see one another.

b) Auditory communication

Barking, growling, hissing and purring all are considered animal auditory communication. Sounds can be used to attract mates, ward off threats and express happiness or pain.

For example, dog bark when approached by a stranger. Red squirrels use a series of rattles,

Screeches and yips to warn intruders to stay away. And dolphins used auditory communication to set them selves apart from others - a unique whistle that also helps them locate food.

c) Tactile Communication

Like humans, animals can rely on tactile communication touch - to convey messages. most animal use this form of communication to show affection, fear or even to establish dominance. for instance, horses will kick each other to threats off or when competing for a kitten, cats will nuzzle their mothers to affection. many species of primates will touch each other to bond and show affection.

d) Chemical communication

For some species of animals, communication is about pheromones or chemical markings. They will leave their own scents to mark their territories, ward off predators or attract a mate.

The most well-known example is that of Skunks 'spraying' their signature scents when threatened. cats will rub against objects to make their territories, leaving scent markers from their mouths.

Vocal response and communication in

a) Rabbit

- by rabbit dance → when rabbit are very excited or happy, they play a distinctive dance that is sometimes called binkying. A binkying rabbit will be full of the joys of spring, bounding about jumping up high and twisting about in the air, kicking their feet out.
- zooming around → you have probably seen a dog or a cat having a "bunny blue minutes": when they suddenly start to zoom around and act crazy for no particular reason, before plumping rabbits do exactly the same thing.
- flopping down → Rabbits have short bursts of energy and then like to have a little nap. So you may sometimes spot your rabbit all of sudden just flopping down as if they are exhausted, and having a little rest.
- licking and grooming → Rabbits can clean little animals that spent lot of time grooming their own coats. Social groups - rabbit will also groom other. this indicates the great compliment and trust. Jane.

- Thumping - Rabbits will sometimes kick the ground with their hind legs, which produce a kind of thumping sound. This becomes a method of communication with other rabbits in the area, and may mean that your rabbit feels unsafe or threatened, and is trying to warn others.
- Shrieking → hopefully you will never even hear a rabbit shriek, because shrieking is a sign of serious pain or extreme fear. Rabbits have very small fast beating little hearts, and significant stress, pain or fear can kill them.

In greeting when you come home, when she meets up with you in the house and when you speak to her.

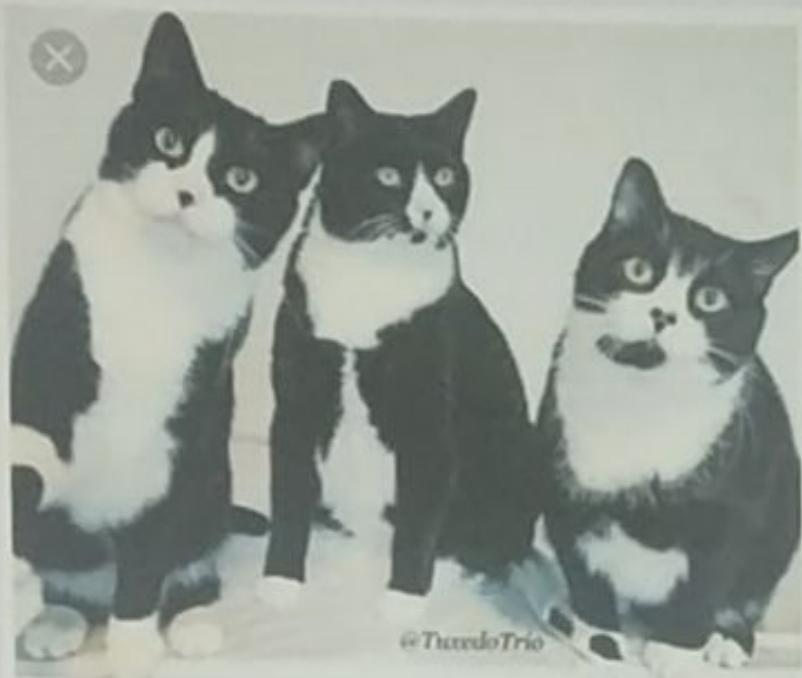

- to ask for food → most cats like to eat, and they can be quite demanding around mealtimes. Some cats learn to meow whenever anyone enters the kitchen. Just in case food might be batch cooking - other meow to wake up to serve them food.
- To ask to be let in/out → meowing is the cat's primary way to let you know what she wants. If she wants to go outside, she will likely to learn to meow at the door.
- Elderly cats → suffering from mental confusion or cognitive dysfunction, may meow if they become disoriented - a frequent symptom of this feline version of Alzheimer's disease. for more refer this article
- To find a mate → Reproductively intact cats are more likely to your females your to attract. their receptivity to males, and males your to gain access to females
- To solicit attention → cats enjoy social contact with people, and some will be quite vocal in their request for attention. the cat may want to be stroked, played with or simply talked to. cats who are left alone for long periods of time each day may be more likely to meow for attention.

Next: response and communication in

a) Rabbit

- zooming around → you have probably seen a dog or a cat having a "bunny five minutes": when they suddenly start to zoom around and act crazy for no particular reason, before flumping rabbits do exactly the same thing.
- flopping down → Rabbits have short bursts of energy and then like to have a little nap. So you may sometimes spot your rabbit all of sudden just flopping down as if they are exhausted, and having a little rest.
- licking and grooming → Rabbits can clean little animals that spent lot of time grooming their own coats. Social groups - rabbit will also groom other. this indicates the great compliment and trust. Jane.

b) Cat

Cats are very social. They greet each other through nose touches. They show affection by rubbing their heads against each other and along the sides of their bodies. Sometimes cats may be hook their tails and rub them together.

The cat meow is their way of communicating with people. Meowing is an interesting vocalization in that adult cats don't actually meow at each other, just at people. Kittens meow to let their mother know they're cold or hungry, but once they get a bit older, cats no longer meow to other cats.

The following reasons are the most common reason why cats meow are.

- To greet people → your cat can be expected to meow

Vocal Responses And Communication In Aves.

Introduction →

Studies of vocal behavior in birds have made central contributions to animal behavior and the neuro sciences. A well-known body of research has built on the discovery that vocal production in birds, particularly song birds, is underpinned by an elaborate, hierarchical array of song nuclei distributed throughout the brain.

Elucidation of the song system has proceeded apace, powered by a host of methodological advances including *in vivo* single cell recording, *in vitro* recordings from brain slices, selective photo-ming, and neuronal tracings. The specialised nature of the song system for vocal production is exemplified by two key observations.

The neural morphology of the song system varies seasonally, in a manner that corresponds to variation in vocal output, and in species in which males sing but females do not, song system nuclei are comparatively reduced in females. Studies of the avian vocal system continue to provide key insights into neural mechanisms of motor control.

This entry focuses on three additional, complementary lines of research in the avian vocal system that hold particular relevance for the neurosciences:

* The vocalization of some bird groups, including songbirds, humming birds, and parrots, develop through imitative learning, in a manner that parallels speech acquisition in humans. Vocal learning in songbirds is now known to be mediated by a specialized neural pathway, the development of which depends on birds auditory experiences.

A developmental stress hypothesis suggests that learned song can provide a reliable indicator of a male's neural developmental history and that females may thus use vocal parameters to assess the quality of prospective mates.

Experimental studies with hand-reared birds illustrate a previously unrecognized axis of plasticity in sensorimotor development, in which birds faced with physical limits on vocal model reproduction can calibrate their targets of learning.

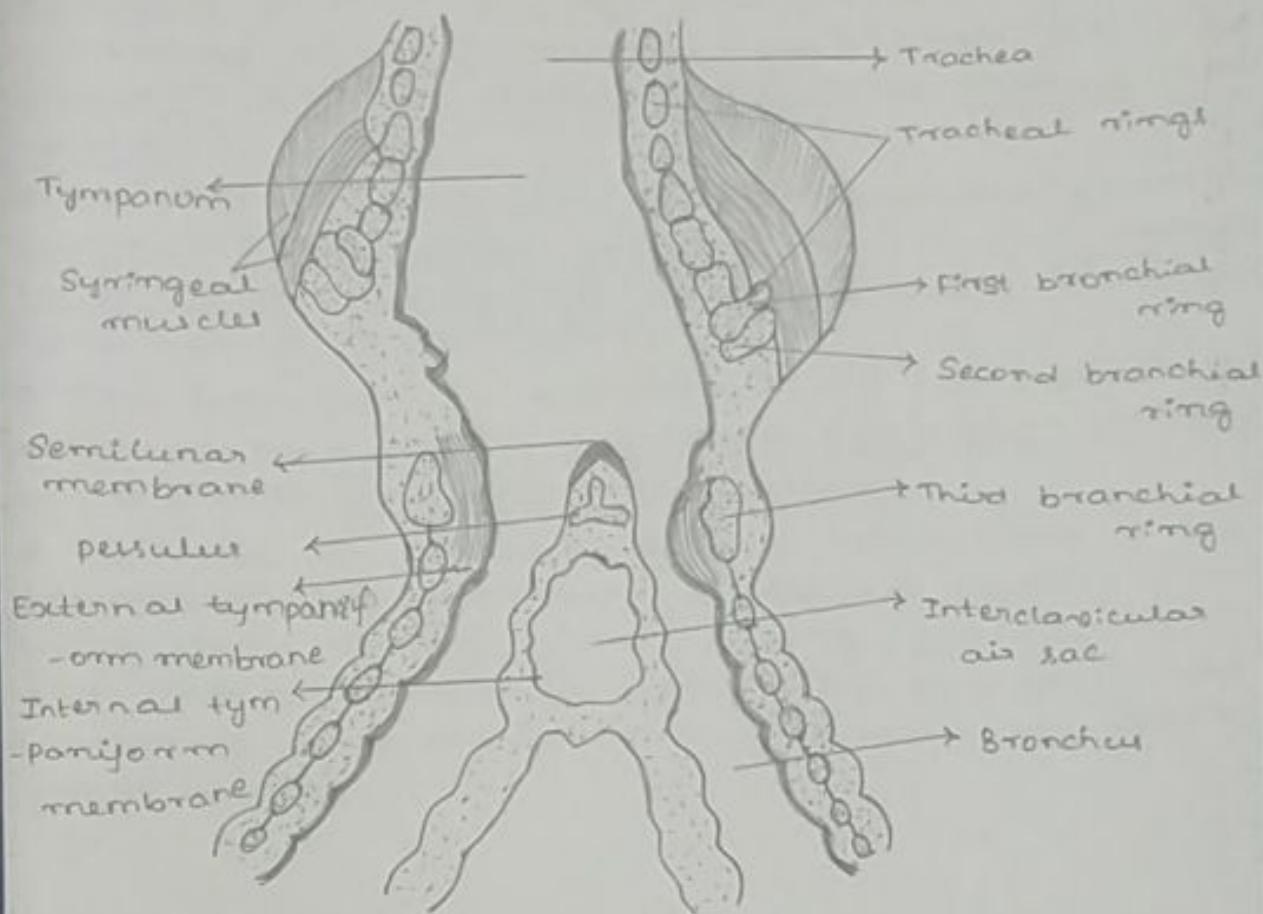

* vocal production entails extensive use of peripheral mechanisms. The vocal acoustic source, the syrinx is dynamically co-ordinated with activity of the respiratory and vocal tract motor systems. Rapid and precise modulations in breathing pattern are required for the production of intricate vocal timing patterns, and modulation of vocal tract configuration during phonation enables birds to adjust vocal tract resonances and thus the spectral properties of song.

It is not yet clear how birds manage to co-ordinate these multiple motor systems in vocal production, in terms of both neural control and its development. Limits on vocal performance, associated in particular with peripheral systems of vocal production, have been shown to constrain the production and evolution of certain vocal parameters.

* The biological function of bird song has been examined with vocal playback studies, which are providing new insights into birds' perceptual and recognition abilities. Field playback tests have been conducted primarily with territorial males, in which vocal stimuli are presented to simulate territorial intrusions.

Laboratory playback tests have been used to test bird's perceptual capabilities and limitations, and the preferences of females for different vocal stimulus classes. In conjunction with analyses of vocal variation, these studies are recognition. Interactive playback studies are helping researchers assess how birds modulate vocal output to convey varying levels of aggressive intent.

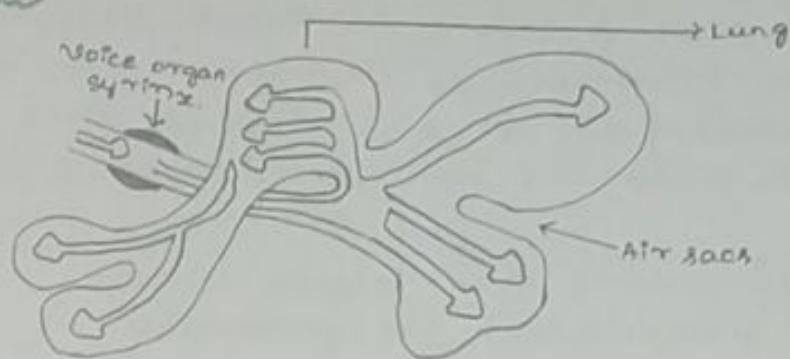

L.S OF SYRINX OF BIRD →

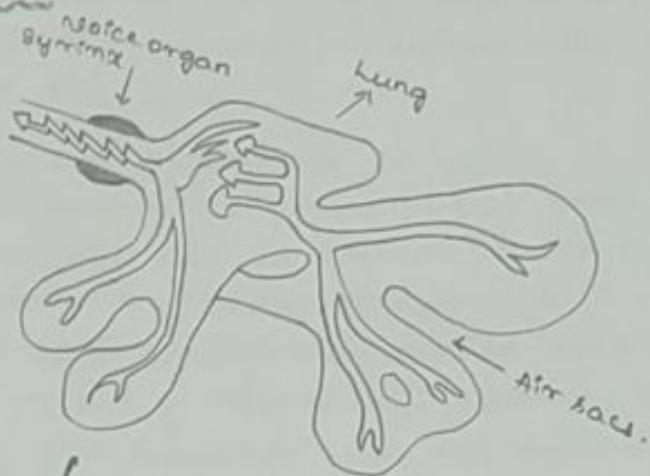

The 'Syrinx' is the vocal organ of birds located at the base of a bird's trachea. It produces sounds without the vocal folds of mammals. Thus lateralization of bird song is possible and some song birds can produce more than one sound at a time.

- * Syrinx is concerned with the sound production and is a characteristic of birds, but absent in Ostrich, Storks and some vultures.
- * It consists of an expanded chamber called tympanum.
- * Its walls are supported by the last three or four rings of trachea and first half ring of each bronchus.
- * pesillus is a bony ridge which extends dorso-ventrally at the junction of two bronchi and gives support to a small vibratory crescentic mucous membrane.
- * The mucous membrane of each bronchus forms an external tympaniform membrane and an internal tympaniform membrane associated with the respective wall of the bronchus.
- * These tympaniform membranes are controlled and regulated by a pair of intrinsic syrinxial muscles and a pair of Sternotracheal muscles.
- * The voice is produced by the vibrations of the tympaniform membranes as the air expelled from lungs passes between them during expiration and pitch of the voice is altered by changes in the tension of these membranes controlled by above given muscles.

1. INHALATION

2. EXHALATION

Vocal Learning →

Some birds learn to sing using a diversity of learning strategies or programs. As with human speech development, vocal imitation in birds includes sensory and sensorimotor phases. During the sensory phase, birds memorize song models on which they are exposed.

The sensorimotor phase, defined by transition of vocal output from bubble like sub-song to crystallized adult forms, is mediated by comparison of vocal output to memorized song models by comparison via auditory feed back. During this phase, birds develop general proficiency with the vocal apparatus, as well as proficiency in the reproduction of memorized song models.

INTRODUCTION

Parental care is extremely diverse across species, ranging from simple behaviours to complex adaptations, varying in duration and in which sex cares.

The egg attendance, arguably one of the simplest care behaviours, is gained and lost faster than any other care form, while complex adaptations like brooding and viviparity, are lost at very low rates. Prolonged care from the egg to later developmental stages evolves from temporally limited care, but it is easily lost as it is gained. Finally, biparental care is evolutionarily unstable regardless of whether the parents perform complementary or similar care duties.

Parental care evolved to reduce the eggs or juveniles till they reach the reproductive age. This care is evolved to reduce the energy expenditure on reproduction, as in the absence of it animals must produce millions of eggs so that few could survive to replace the parents to ensure existence of the species. Terrestrial environment being much

harsher than the aquatic one, amphibians were the first vertebrates to have evolved different kind of parental care to protect their young ones.

Duration of parental care is highly variable between species. Prolonged care should entail higher costs to the parents in terms of energy, time and lost mating opportunities than temporally limited care. Early care at the egg stage in amphibians is believed to facilitate the evolution of care at later developmental stages by prolonging attendance and guarding behaviour beyond hatching.

Some forms of parental care such as egg or offspring attendance, are much more common than others and this may be due to differences in their phenotypic complexity.

PARENTAL CARE

Parental care is defined as any parental behaviour or adaptation that increases offspring fitness, often at some cost to the carer exhibits striking diversity among species, ranging from short term and relatively simple behaviours, such as egg attendance, to long term and elaborate adaptations, like some forms of food provisioning, viviparity and lactation. Not only does parental care affect the fitness of offspring and parents, but it has profound consequences for social evolution it leads to both cooperation and conflict within families, is associated with changes in species life history strategies, is related to mating system and sexual selection and is one of the main drivers for the evolution of sociality.

Some forms of parental care, such as egg or offspring attendance are much more common than others and this may be due to differences in their phenotypic complexity.

Care at the egg stage in amphibians is believed to facilitate the evolution of care at later developmental

stage by prolonging attendance and guarding behaviour beyond hatching.

Prolonged parental care through the acquisition of care at the later stages has not, been seen in most of the cases.

The extent of differences in care duration between species depends on the type of care performed and on which sex cares.

MODES OF PARENTAL CARE IN AMPHIBIA

There are six modes of parental care are recognised among the amphibia in different species they are:

1. Egg attendance
2. Egg Transport
3. Tadpole transport
4. Tadpole feeding
5. Tadpole attendance
6. Internal gestation in the oviduct
[Viviparity and ovoviviparity]

TYPE STUDY OF AMPHIBIANS!

REQUIREMENT OF PARENTAL CARE

- Increase offspring survival during the stages in which parents and offspring are associated.
- Improve offspring quality in a way that leads to increased offspring survival.
- Parental care increases the reproduction in the future in offspring when parents are no longer associated with offspring.
- Helps in prevention of offsprings from the predators.
- Proper feeding for the offsprings.
- Nourishment for young ones.
- Extreme care until the nutritional independence.

DERMOPHISMEXICANUS

Dermophismexicanus is a central American Salamander, whose embryos are 2mm in diameter and feed on the egg yolk supply for only about three months of gestation before the yolk supply is exhausted. After that the mother produces a nutritious secretion from the lateral oviductal glands. Foetal caecilians move around within the oviduct and have specialized dentition with which they scrape the oviduct skin in order to stimulate and ingest the mother's nutritive secretion. The dentition is shed at birth and a different adult dentition is rapidly acquired within a few days. Foetuses also have elaborate tri-branched gills for respiration.

CRYPTOBRANCHUS

They are generally found living in depressions under stones in streams and rivers. *Cryptobranchus* lives in eastern North America, where mating occurs in late summer or early fall. Males prepare nests below large, submerged stones or logs. Females lay long, paired strings of several hundred eggs which are fertilized externally by the male. Males guard the eggs until they hatch in 2-3 months after egg-laying.

Introduction :-

'Axolotl larva' of salamander of the family 'Amby-
omatidae' (order caudata), notable for its permanent
retention of larval features, such as 'external gills'.
The species is found only in Lake 'Xochimilco', within
Mexico city, where it is classified as a critically
endangered species. The name axolotl is also applied
to any full-grown larva of '*Ambystoma tigrinum*'
that has not yet lost its external gills.

A. mexicanum grows to about '35 cm (10 inch)'
long and is 'dark brown' with 'black speckling',
both 'albino' and 'white mutants', as well as other
colour 'mutants', are common. The legs and feet
are rather small, but tail is long. A fin extends
from the back of the head to the tip of the
tail. A lower fin extends from between the hind
legs to the tip of the tail. The Axolotl is a
paedomorph, that is, it retains its larval
traits throughout adulthood. Axolotls prey
on variety of aquatic organisms including
fish, mollusks, aquatic insects and other axolotls.

Although 'captive axolotl' may live as long
as '15 years', 'axolotl' live for only about 'five
or six years' in the wild.

AXOLOTL LARVA :-

SYSTEMATIC POSITION :-

- Phylum = Chordata.
- Class = Craniota.
- Sub-phylum = Vertebrata.
- Division = Gnathostomata.
- Super class = Tetrapoda.
- Class = Amphibia.
- Order = Urodele.
- Sub-order = Ambystomoidea.
- Genus = Ambystoma.

Geographical Distribution :-

Found in the 'United States', 'North America' and also found in the 'valley of Mexico', freshwater lake of 'Xochimilco' and 'Chalco'.

Habit and Habitat :-

'Adults' are 'terrestrial' and 'larva' found in ponds, lakes, etc.

They feed on worms, insects and small fishes, as they are carnivorous.

General Characters:-

The Axolotl larva was previously considered adult form and called Sirens.

Later it is found that the Axolotl is the larva Ambystoma tigrinum i.e. Tiger Salamander.

It has three pairs of crimson coloured external gills and 4 pairs of open gill clefts. Head contains eye, nostril and mouth.

Larva is perennial. Body measuring about 37 cm in length is divided into head, trunk, and tail.

tail is present with caudal fin and forelimbs & hindlimbs both are present.

It becomes sexually mature and lays eggs.

Axolotl larva is captivity metamorphosed to adult. Metamorphosis can be induced by injecting thyroid extract into Axolotl larva.

Axolotls of six months are more easily induced to metamorphosis.

Metamorphosis to adult become difficult as larva grows older. The partly metamorphosed tetrapod animal can be again induced to go back to larva stage.

It exhibits facultative neoteny i.e., in the cold water, higher altitude exhibits neoteny, while water of plains, it metamorphose normally.

Recently it is considered under the threatened
species by IUCN.

They were easy to breed when compared to other
salamanders.

It is used as a model organism to study the
reproductive biology by researchers and they are bred in large
numbers in captivity.

Experiments have been made successfully by the
researchers to break neoteny by supplementing with
iodine to water they inhabit or by supplementing
iodine to food or by injecting iodine.

Axolotl larvae of *Ambystoma* do not undergo the
metamorphosis if there is abundance of nutrition
and oxygen supply and they develop gonads like
adults to breed sexually.

* The phenomenon of neoteny or paedogenesis
is either due to the lack of iodine or heredity
and environment. *A. mexicanum* is supposed to
be genetically neotenic.

* Males are identified by their swollen cloaca lined
with papillae, while females are noticeable for their
wider bodies full of eggs. Axolotl have barely
visible vestigial teeth which would have developed
during metamorphosis.

* 3 pairs of external gills are used for respiration
although buccal pumping gulping air from the
surface, may also be used in order to provide the
oxygen to their lungs.

Identification:-

This Axolotl larva has three pairs of legs.

Bilaterally symmetrical, triploblastic, coelomate animal.

Presence of dorsal, hollow, tubular nerve cord.

Presence of notochord only in some stages or whole life.

Presence of pharyngeal gill slits stigma at least in one stage of life.

* Presence of internal skeleton endoskeleton

* Notochord is replaced by vertebral column.

* Distinct cranium or brain case is present.

* Presence of well developed head.

* presence of paired lateral appendages.

* A post anal tail is usually present.

* A closed circulatory system is present

* mouth is bounded by upper and lower jaws.

* upper jaw immovable, lower jaw movable.

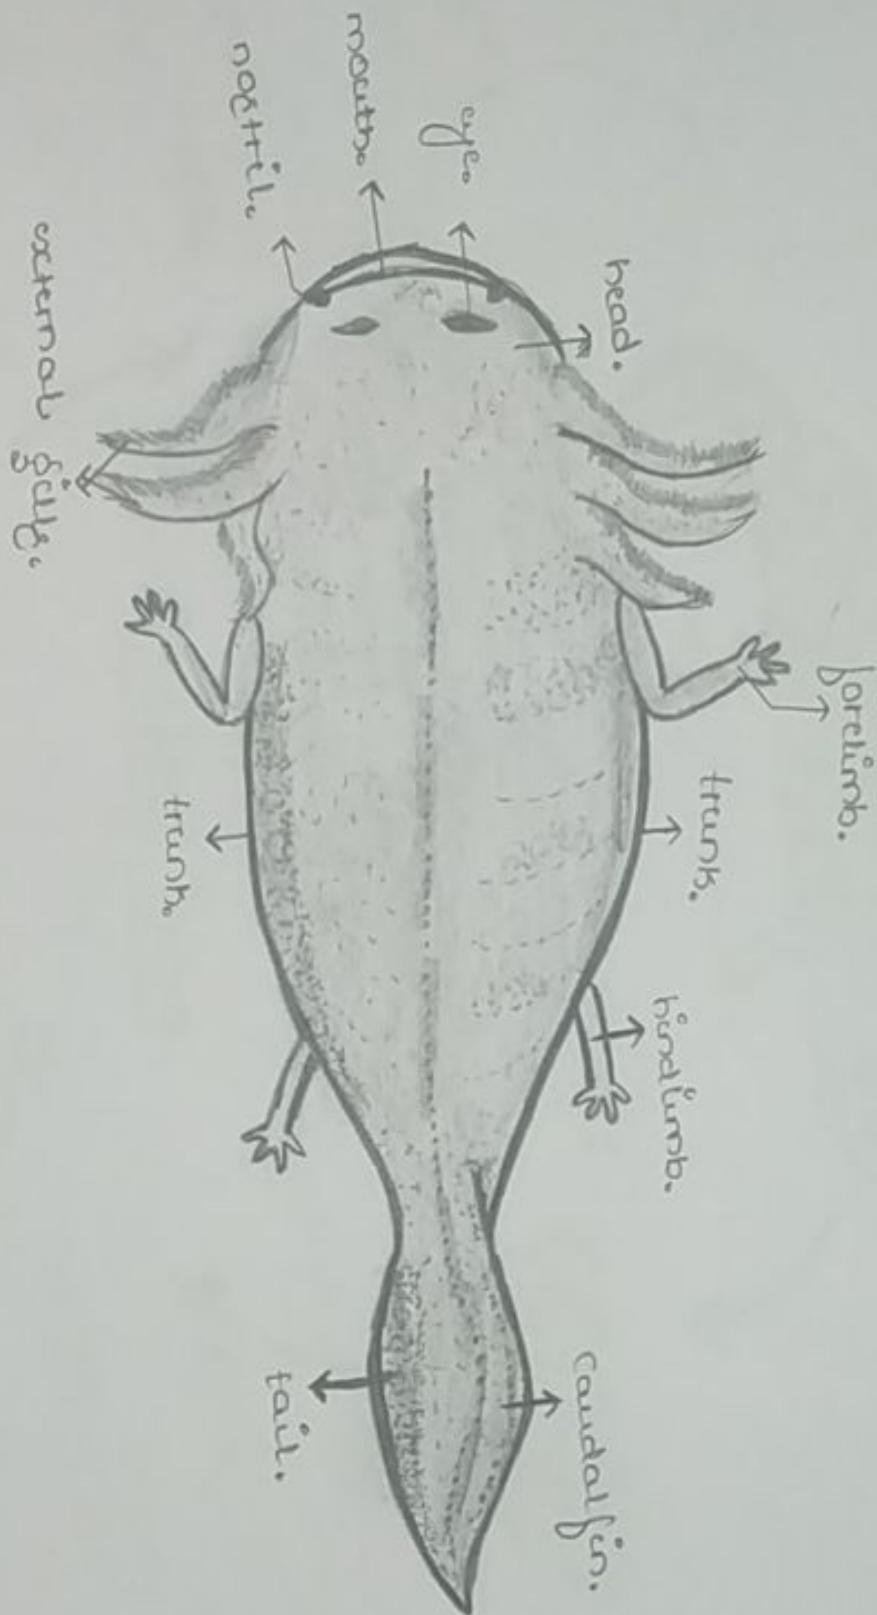

* upper jaw immovable, lower jaw movable.

* teeth may or may not be present on the jaws.

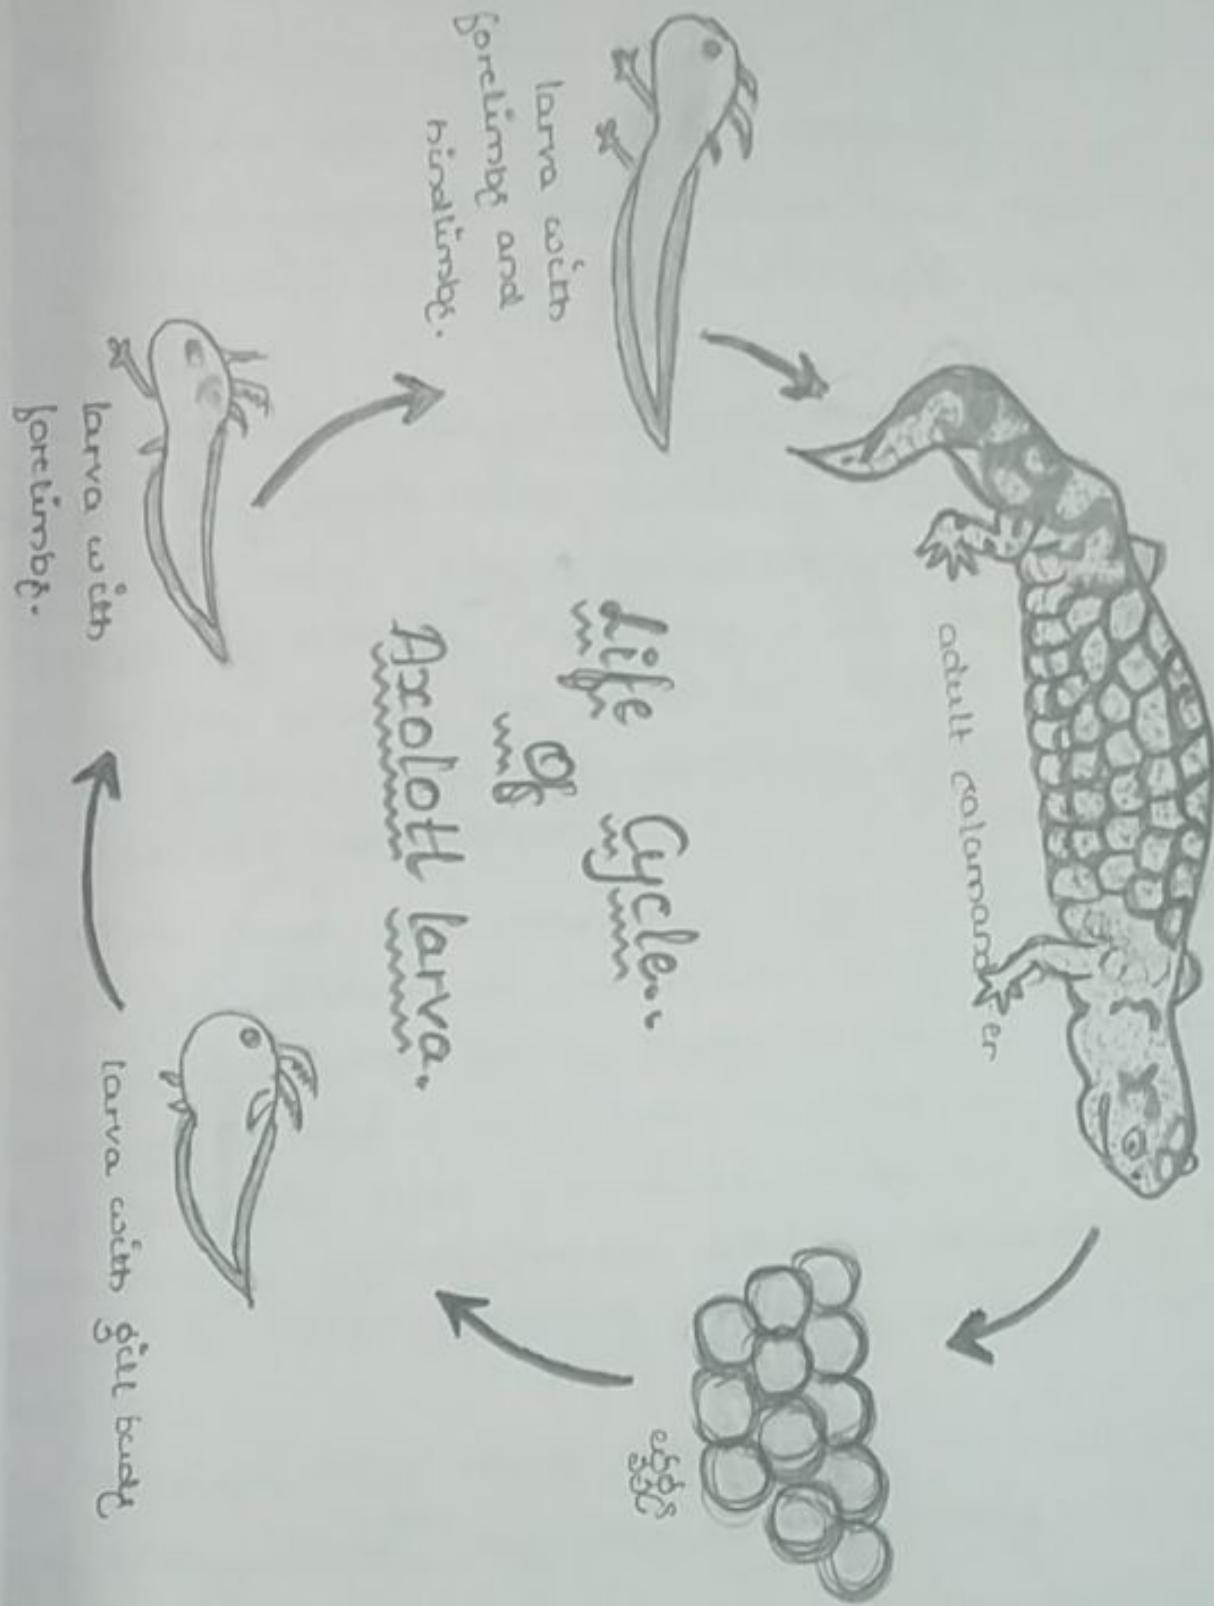

* paired appendages present.

The above reasons also say that why these axolotl larva are classified under phylum chordata, sub-phylum vertebrata and super class Gnathostomata.

Axolotl Larva.

Life Cycle of Axolotl larva.

Importance Of Axolotl

- * The unique physiology and remarkable ability to regenerate severed limbs, it has become an important lab model for everything from tissue repair to development and cancer. But the centuries of inbreeding, captive populations are vulnerable to disease.
- * The Axolotl plays an important role in the Mexico's life style and survival. Before they were endangered they were a valuable food source for the people of Mexico. Axolotls and other salamanders around the world are becoming or are extinct due to factors such as pesticides, predators and habitat destruction.
- * While salamander effects in ecosystems do not go unnoticed, however, in forests, salamanders account for a large amount of the biomass. Certain species even depend on salamanders for their own survival, such as the salamander eating snake, which, according to Wake, is also showing signs of population decline.
- * Because they have the ability to regenerate lost body parts, axolotls are probably one of the most scientifically studied salamanders in the world. Salamanders eat small insects, invertebrates and fish.
